## ZADÁNÍ DIPLOMOVÉ PRÁCE

(PROJEKTU, UMĚleckého díla, UMĚleckého výkonu)

Jméno a příjmení: **Bc. Lenka KARLOVÁ**

Osobní číslo: **S12N0053K**

Studijní program: **N2301 Strojní inženýrství**

Studijní obor: **Stavba výrobních strojů a zařízení**

Název tématu: **Kuželočelní řaditelná převodovka pro rig**

Zadávající katedra: **Katedra konstruování strojů**

### Zásady pro výpracování:

Základní požadavky:

Navrhnout a provést konstrukční výpočty kuželočelní převodovky. Navržené řešení musí splňovat specifikované požadavky zadavatele.

Základní technické údaje:

Technické parametry jsou uvedeny v příloze zadání.

Osnova diplomové práce:

1. Vypracování konstrukčního návrhu včetně systematické specifikace požadavků a konceptních variant, výběr optimálního řešení.
2. Zjištění klíčových vlastností konstrukčního návrhu s potřebnými technickými výpočty.
3. Vypracování potřebné technické dokumentace.
4. Komplexní zhodnocení.

Rozsah grafických prací: **dle potřeby**  
Rozsah pracovní zprávy: **50-70 stran A4**  
Forma zpracování diplomové práce: **tištěná/elektronická**

## 1. Úvod

Cílem této diplomové práce je navrhnout převodovku ve dvou variantách podle zadaných parametrů a požadavků zadavatele. Převodovka bude pracovat na ropné plošině plovoucí v moři. Bude sloužit k pohonu navijáku lan, která plošinu kotví a vyrovnávají její polohu.

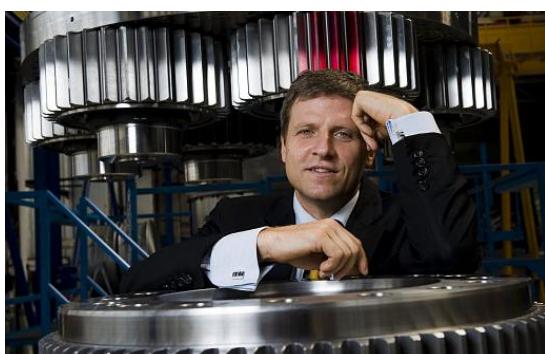

## 2. Představení zadavatele

Zadavatelem diplomové práce je firma Wikov Gear, Tylova 1/57, 301 00 Plzeň, která je součástí holdingu Wikov Industry. Jde o významnou firmu, která je pokračovatelem části bývalého koncernu Škoda a má tak tradici ve strojírenství více než 125 let a ve výrobě ozubených kol a převodovek více než 80 let. Holdingová společnost Wikov Industry má následující strukturu

- Wikov Industry je holdingová skupina s ředitelstvím v Praze.
- Wikov MGI konstruuje a vyrábí speciální převodovky pro široké spektrum průmyslových aplikací, kolejová vozidla a větrné turbíny.
- Wikov Gear vyrábí velké převodovky a díly převodovek pro těžební průmysl, cementárny a průmysl těžby ropy a plynu.
- Wikov Wind poskytuje kompletní dodávky větrných elektráren včetně stavby a servisu-vání.
- ORBITAL2 je konstrukční kancelář především pro aplikace větrných elektráren.
- Wikov China je naše zastupitelská kancelář v Číně.
- Wikov Sázavan je výrobní závod specializující se na výrobu strojních celků a precizní obrábění jejich komponent.

Firma má obchodní zastoupení v Bulharsku, Indii, Indonésii, Íránu, Korei, Nizozemí, Belgii, Lucembursku, Rusku, Singapuru, Turecku, USA a Kanadě.

Jednatelem společnosti Wikov Industry a zároveň jediným akcionářem je dle Obchodního rejstříku (ke dni 27.4.2014) Mgr. Martin Wichterle [19], vnuk špičkového českého chemika prof. Otty Wichterleho (vynálezce např. kontaktních čoček) a pravnuk zakladatele významných strojíren v Prostějově, kde se vyráběly parní lokomotivy, zemědělské stroje a automobily.

Obr. 2-1 Mgr. Martin Wichterle

Wikov Gear je výrobní závod s cca 150 zaměstnanci specializující se na:

- Design a výrobu převodovek pro:
  - Tepelné elektrárny
  - Povrchové doly
  - Cementárny a zpracování minerálů
  - Průmysl těžby ropy a plynu
  - Cukrovary
  - Chemický průmysl
- Design a výrobu rychloběžných převodovek
- Výrobu kuželových kol s ozubením Klingelnberg do průměru 1150 mm (lapované a HPG)
- Výrobu profilově broušených ozubených kol s přímým vnitřním a vnějším ozubením do průměru 2500 mm
- Výrobu frézovaných ozubených dílů do průměru 3500 mm

Pro odvětví Těžba ropy a plynu a Loděařský průmysl firma dodává

- Převodovky pro tyto aplikace:
  - kotevní, uvazovací, tažné či kombinované vrátky
  - naviják vrtného systému
  - čerpadlo hasicího zařízení
  - kalové čerpadlo
  - hlavice vrtného systému
  - převodovky pohonu lodí s hydraulickým ovládáním propeleru
  - přesná ozubená kola s čelním ozubením do průměru 2500 mm – dle DIN3961 do přesnosti IT4 (3)
- Rychloběžné převodovky pro:
  - pohon plynových turbín
  - pohon turbokompresorů
  - pohon čerpadel
  - pohon motor/generátor
- Sady ozubených kol pro dieselové motory:
  - dělená kola pro klikové hřídele
  - rozvodová kola
- Sady cyklopaloidních soukolí Klingelnberg do průměru talířového kola až 1150 mm pro thrustery
- Přejímky produktů u renomovaných přejímacích společností, jako jsou např.: BV, DNV, LRS, GL, ABS, KR, a další

1. **Pevná plošina** - zabetonována do mořského dna, použitelná do hloubky 500 m
2. **Jack-up plošina** - vybavena vlastními vysouvacími nohami, použitelná do hloubky 120 až 150 m
3. **Volná nebo mobilní plošina** - ukotvená lany ke dnu, použitelná do hloubky 900 m
4. **Poloponorná plošina** - nadnášena pontony a ukotvena ke dnu, použitelná do hloubky 3200 m
5. **Vrtací souprava na lodi** - je použitelná do hloubky 3700 m

### 3. Upřesnění zadání

Úkolem práce je navrhnout konstrukci redukční převodovky pro činnost lodního manipulačního navijáku lana podle požadavků zadavatelské firmy. Točivý moment se přenáší z převodovky drážkováním vždy pouze na jednom ze dvou konců výstupního hřídele. Jako pohon je určen elektrický motor. Točivý moment je z motoru přenášen pomocí pera.

Životnost je požadována 2400 hodin. Odpovídá době životnosti plošiny 20 let. 20 % doby je převodovka zatížena 100 % maximálního zatížení, 80 % doby životnosti je zatížena do výše 70 % max. zatížení. 50% provozní doby tvoří reverzní chod.

Převodovka bude mazána broděním s použitím syntetického oleje typu PG (na bázi polyglykolů). Při poklesu teploty oleje pod 15°C se použije ohříváč oleje, který je možné odstranit bez vypuštění oleje. Teplota oleje nesmí překročit 65°C. K chlazení slouží vodní chladič ve formě spirály z nerezové oceli.

Skříň navrhnut univerzální pro uspořádání hřídelů vstupu a výstupu rovnoběžně (pro převodovku typu C) i kolmo (pro převodovku typu KC).

Převodovka typu C i typu KC má mít dvě výstupní rychlosti. Řadicí mechanismus, který bude použity, už je využíván u jiných výrobků firmy a není součástí řešení této práce.

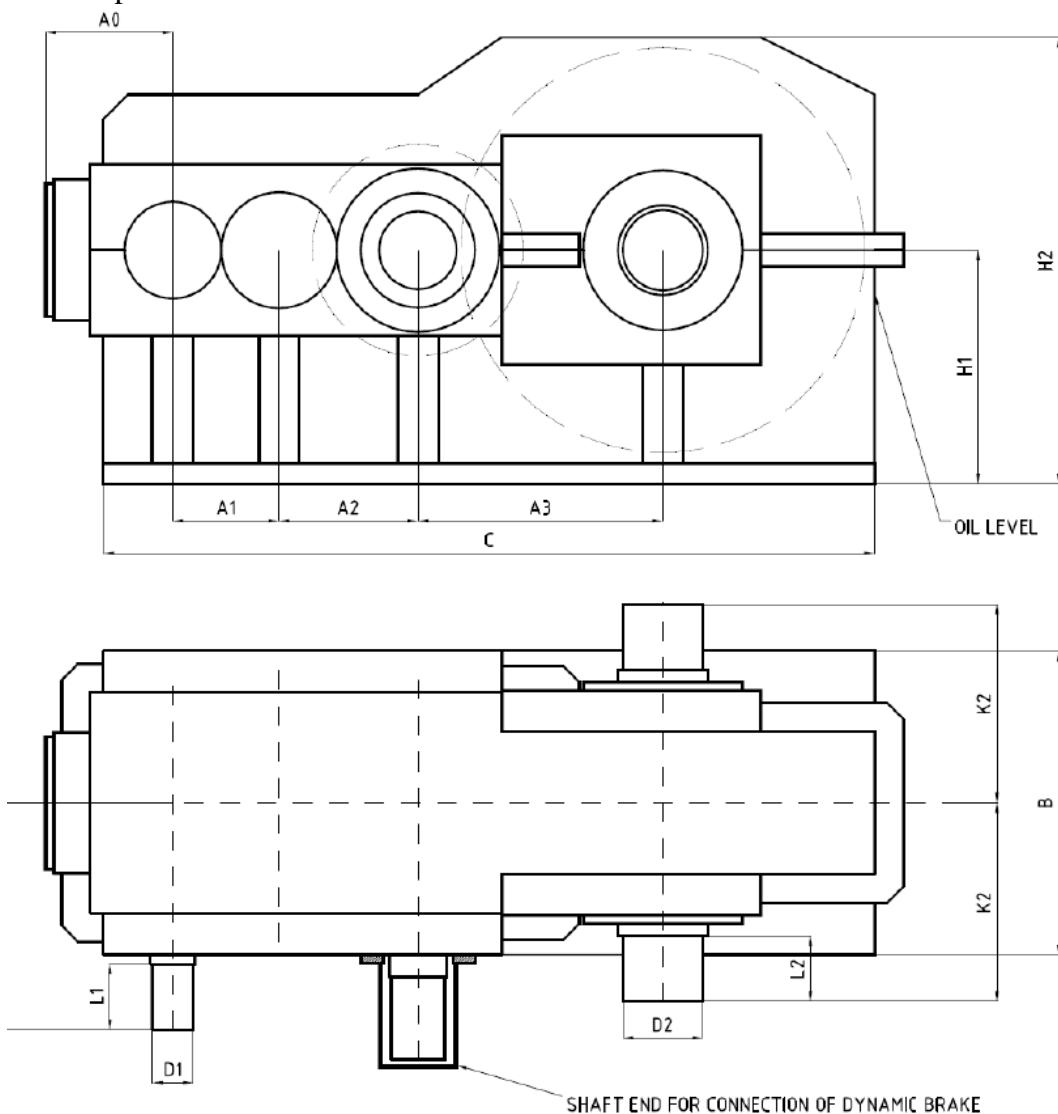

Na výrobu ozubených kol použít přednostně materiál 18CrNiMo7-6.

### 3.1. Požadavky zadavatele

Součástí zadání je orientační požadavek na rozměry skříně. Zadavatel chce používat jednu univerzální skříň pro dva typy převodovek. Na prvním obrázku je rámcová představa skříně převodovky s rovnoběžně uloženými hřídeli (typ C). Průměr vstupního hřídele je 100 mm a délka přesahující skříně je 160 mm. Výsledný převod má být uskutečněn pomocí tří převodů. Osově vzdálenosti budou stejné u obou typů převodovky. Je určena délka, šířka a výška skříně. Výstupní hřídel bude na obou koncích drážkovaný (260x5x50), délka pro spojení bude 200 mm. Výstupní hřídel přesahuje symetricky obrys skříně o 180 mm na každé straně. Na obrázku je určeno místo pro připojení dynamické brzdy na třetím hřídeli. Je to jen jedna z možností brzdění a pro řešení této práce bude hřídel překrytý víčkem. Přibližné rozměry jsou v tabulce pod obrázkem.

Tab. 3-2 Rozměry převodovky typu C v mm (označené v Obr. 3-1)

Typ převodovky KC (Obr. 3-2) vychází z předchozího typu C. Je rozšířen o vstupní hřídel, který je kolmý ke stávajícím (kolmý k výstupnímu). Osa vstupního hřídele má ležet v dělicí rovině skříně a v ose převodovky. Původní vstupní hřídel nemá nepřesahovat obrys skříně. Ostatní rozměry zůstávají stejné jako u typu C.

Tab. 3-3 Rozměry převodovky typu KC v mm (označené v Obr. 3-2)

### 3.2. Požadované zatěžovací stavy

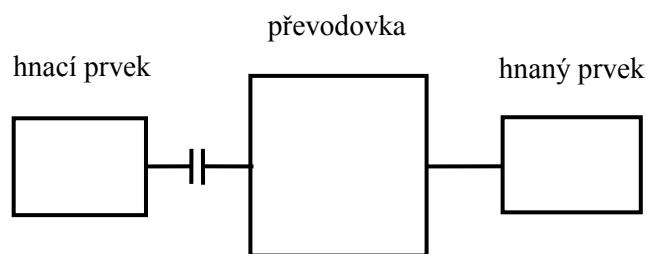

Celková doba životnosti je rozdělena v poměru 1:4. Dvacet procent času bude převodovka zatížena na 100% výkonu; osmdesát procent času bude zátěž 70%. Polovinu obou časů bude tvořit reverzní chod.

## 4. Převodovka

Převodovka umožňuje mechanický převod. Je to technické zařízení, které realizuje změnu rotačního pohybu na rotační pohyb s jinou úhlovou rychlostí a točivým momentem. Může umožnit nastavení jednoho nebo více převodových stupňů. Převodovka je součástí pohonného systému. Vytváří kinematickou a silovou vazbu mezi vstupním a výstupním členem.

Převodovky rozdělujeme na převodovky se stálým převodovým poměrem a na převodovky s proměnlivým převodovým poměrem (variátory).

Je-li výstupní rychlosť nižší než vstupní, jde o převodovky redukční. V opačném případě říkáme převodovkám multiplikátory.

Obr. 4-1 Základní schéma převodového mechanizmu

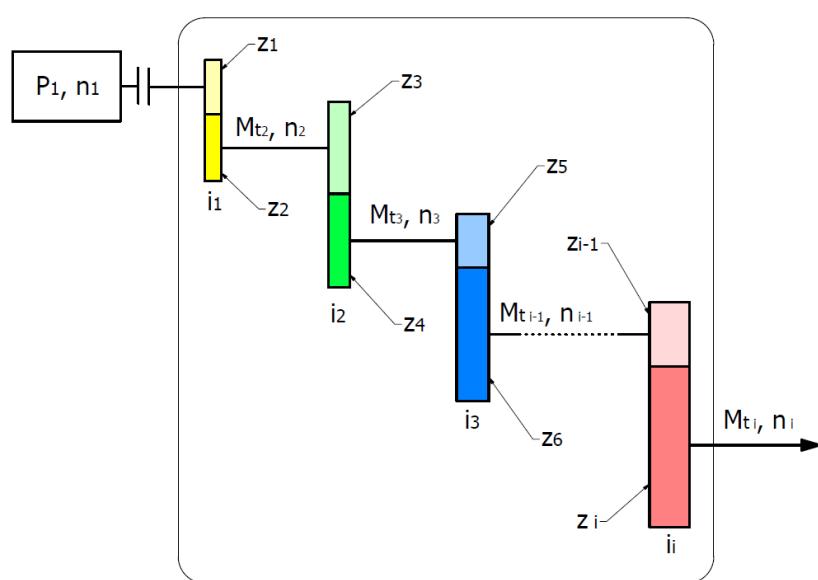

Hnací prvek představuje spalovací motor, turbomotor, hydromotor, elektromotor nebo ruční kliku.

Výstupní pohyb převodovky může být rotační nebo posuvný.

Funkčními parametry převodovky jsou příkon (nebo vstupní točivý moment), výstupní otáčky (nebo posuvová rychlosť na výstupu), celkový převodový poměr, celková účinnost a životnost.

Rozměrovými parametry jsou rozměry připevnění k základu a vzájemná poloha vstupní a výstupní osy.

Provozními parametry jsou provozní teplota, počet rozběhů za čas a zatěžovací spektrum.

Obr. 4-2 Kinematické schéma převodovky s rotačním výstupním pohybem

## 4.1. Členění převodovek

### 4.1.1. Podle kinematiky

- rotační → rotační  
vstupní energie do převodovky je přenášena rotačním pohybem hřídele, výstupní energie je přenášena rotačním pohybem hřídele, ale s jinou charakteristikou, (jiné otáčky / jiný kroutící moment / jiný směr otáčení)
- rotační → lineární  
vstupní energie do převodovky je přenášena rotačním pohybem hřídele, výstupní energie je přenášena lineárním pohybem (posuvem)
- lineární → lineární  
vstupní energie do převodovky je přenášena lineárním pohybem (posuvem), výstupní energie je přenášena lineárním pohybem (posuvem)
- rotační → periodický  
vstup do převodovky vykonává rotační pohyb, výstup převodovky vykonává periodický rotační (kývavý) pohyb nebo periodický posuvný pohyb (tam-zpět)

### 4.1.2. Podle funkce

- lineární  
výstup převodovky je vždy lineárně úměrný poloze vstupu, např. úhlu natočení hřídele
- nelineární  
výstup převodovky vykonává pohyb, který není přímo úměrný vstupu převodovky (spojitý, nelineární) případně může být výstup z převodovky přerušovaný (nespojitý, nelineární).

### 4.1.3. Podle přenosu energie

- obousměrné  
vstup a výstup převodovky je možno zaměnit (zpravidla u jednoduchého soukolí).
- jednosměrné  
převodovka má určenou vstupní a výstupní stranu pro přenos energie (zpravidla vícestupňové převodovky).
- samosvorné  
konstrukce převodovky principiálně neumožňuje obousměrný přenos výkonu (např. šroubové a šnekové převodovky). [8]

### 4.1.4. Podle provedení

- s přímými, šikmými nebo šípovými zuby – rovnoběžné vstupní a výstupní hřídele
- s kuželovým soukolím – různoběžné vstupní a výstupní hřídele
- se šnekovým převodem – kolmé vstupní a výstupní hřídele

## 4.2. Vlastnosti výrobků

Samotná volba jednotlivých prvků výrobků, tedy i převodovek, se provádí podle různých kritérií. Existuje řada různých vlastností, které lze utřídit do určitých skupin nebo tříd. Vlastnosti se dají dělit na tři skupiny vlastností:

1. **Vlastnosti deskriptivní** – tedy vlastnosti, které daný technický systém popisují zvnějšku – jak objekt vypadá, jako např. jeho tvar, rozměr, materiál a barva
2. **Reaktivní vlastnosti** – což jsou vlastnosti, kterými objekt reaguje na vnější podněty, jeho reakce na okolí. Tuto skupinu vlastností lze dále rozdělit do podtříd:
  - a) Fyzikální vlastnosti – lze je popsat fyzikálními veličinami a jsou také měřitelné a kvalifikovatelné fyzikálními jednotkami soustavy SI. Mimo jiné tuhost, pevnost, tvrdost a houževnatost.
  - b) Interaktivní vlastnosti – vyjadřují odolnost vůči působení okolního prostředí na objekt jako např. odolnost vůči chemicky agresivnímu prostředí nebo odolnost vůči korozi apod.
  - c) Technicko-výrobní vlastnosti – využití objektu v praxi, především vyrobiteľnost objektu (např. obrobiteľnost), dále vhodnost a možnosti spojení např. svařitelnost
- 3) **Reflektivní vlastnosti** – vlastnosti, jakými objekt působí zpět na okolí. Jsou to jeho provozní a výrobní vlastnosti; ekonomické, distribuční a legislativní vlastnosti; ergonomické, ekologické a likvidační vlastnosti

## 4.3. Stavební struktura převodovky

- převodové prvky  
slouží k převodu jednoho typu pohybu na pohyb s jinými parametry (např. úhlová rychlosť, točivý moment)
- přenosové prvky  
slouží k přenosu zatížení mezi převodovým prvkem a rámem
- uložení rotačních částí  
slouží k zajištění jednoznačné polohy hřidel vůči rámu (kriteria při jejich volbě jsou únosnost, životnost, tuhost, vůle, tepelné poměry, mazání)
- Spojovací prvky pro přenos točivého momentu

### 4.3.1. Převodové prvky

- Ozubené čelní válcové (účinnost převodu asi 0,98)
- Ozubené kuželové (účinnost převodu asi 0,96)
- Ozubené šnekové (účinnost převodu do 0,6)
- Třecí
- Řetězové
- Řemenové
- Převod pohybový šroub – pohybová matice
- Vačkový mechanizmus
- Klikový mechanizmus

### 4.3.2. Prvky pro přenos zatížení

- Hřídele

#### **4.3.3. Uložení rotačních částí**

- Valivá ložiska
- S plošným dotykem
  - kluzná ložiska
  - hydrostatická ložiska
  - hydrodynamická ložiska

#### **4.3.4. Spojovací prvky pro přenos točivého momentu**

- Kolíky
- Pera
- Drážkování
- Nalisování
- Rozpěrné kroužky

#### **4.3.5. Rám – převodová skříň s výztužnými žebry**

- Svařenec
- Odlitek
- Kombinace

#### **4.3.6. Prvky zajišťující další funkce**

- Mazání
- Chlazení
- Těsnění

#### **Mazání**

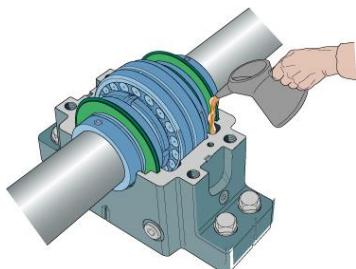

Mazání snižuje třecí odpory a opotřebení funkčních ploch, tím zvyšuje účinnost, přesnost a životnost, a snižuje hlučnost. V převodovkách jsou místa s vyššími nároky na mazání – ložiska, spojky, ozubená kola, vodicí plochy. Jinde stačí přetržité mazání. Způsob mazání dělíme podle počtu mazaných míst na centrální a jednotlivé. Mazat lze pevným mazivem (grafit, teflon) olejem nebo tukem (plastickými mazivy).

Mazací soustavy, kde mazací medium oběhne soustavou jen jednou, nazýváme ztrátové. V uzavřených soustavách obíhá mazivo stále. Soustava může být beztlaková nebo s působícím tlakem [11].

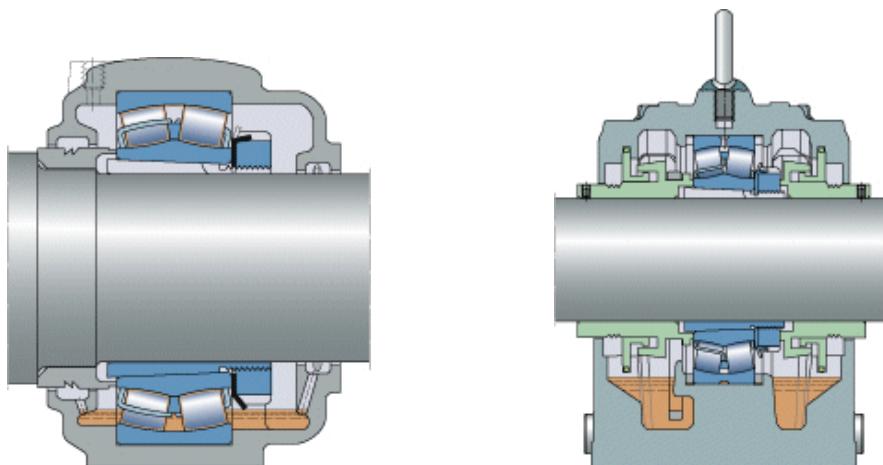

#### **Způsoby nanášení maziva na funkční plochy:**

- ruční  
Nalítím maziva do označených maznic.
- kapáním  
Zcela ztrátový systém.
- rozstříkem, broděním  
Některé části jsou částečně ponořeny v oleji. Olej svým pohybem nabírají a rozstříkují. Hloubka ponoru je cca polovina výšky zuba. Používá se do obvodové rychlosti 6m/s. Při vyšších rychlostech olej pění a přehřívá se. Šnekы do rychlosti 4m/s ponořeny více než z poloviny. Může se stát, že se rozstříkované mazivo nedostane na všechna potřebná místa. Zajištění mazání takových míst můžeme dosáhnout změnou tvaru ploch, od kterých se mazivo odráží, nebo musíme přidat některý další způsob mazání.

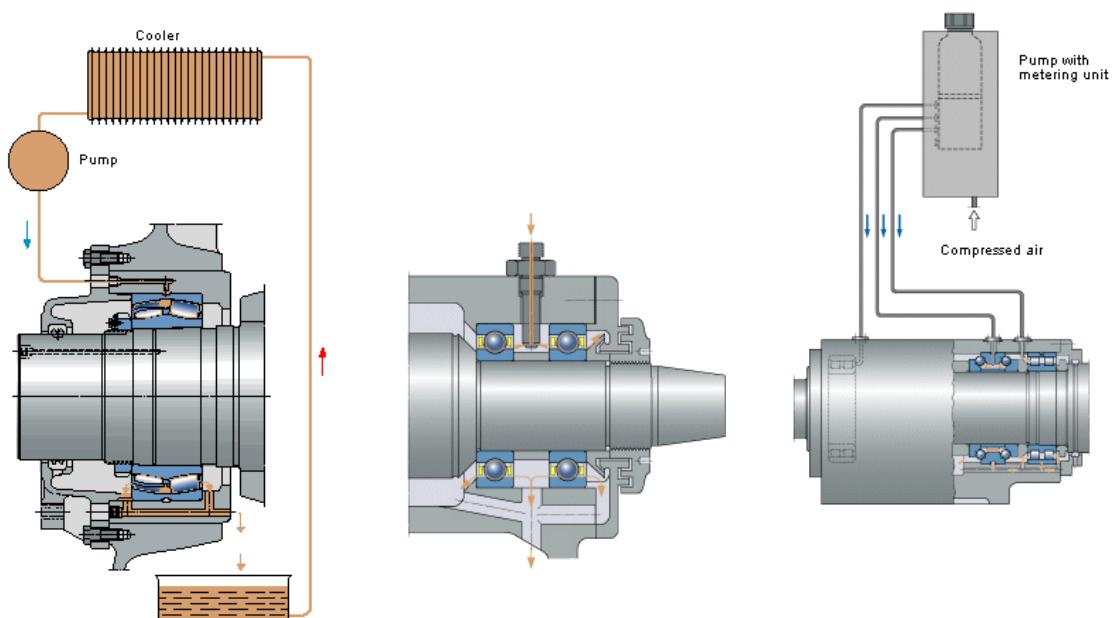

- olejovou mlhou  
Využívá se při vysokých otáčkách. V celém prostoru se díky tlakovému vzduchu tvoří z oleje jemné kapičky.
- oběhové  
Jde o tlakové mazání v uzavřené soustavě, které plní více funkcí, např. chlazení. Tlak zajišťuje ponorné samonasávací čerpadlo s vlastním elektromotorem.

a mazání systémem olej-vzduch [7]

## Chlazení

K chlazení přistupujeme proto, že při styku zubů dochází nejen k odvalování, ale také ke skluzům. Ty se podílejí na snížení účinnosti převodovky a projeví se ve formě tepla. Převodový olej je třeba přizpůsobit teplotě převodovky. Ideální teploty v převodovce by byly z hlediska oleje kolem  $60^{\circ}\text{C}$ . Je-li vyšší, je třeba zkrátit interval výměny oleje. Přírůstek teploty o  $10^{\circ}\text{C}$  vede ke snížení doby životnosti oleje o 50%. Naopak snížením teploty o  $10^{\circ}\text{C}$  tato doba vzroste na dvojnásobek.

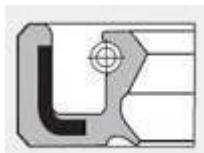

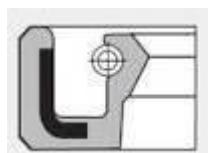

Obr. 4-6 Montážní sada chladiče oleje

## Těsnění

Důvodem k používání těsnění je skutečnost, že nečistoty, které vniknou do soustrojí, mohou být důvodem mechanického poškozování hřidelů a ložisek. To pak vede ke snížení životnosti dílu nebo i celého stroje. Dalším důvodem použití těsnění je zabránění úniku ekologicky nepříznivých médií vně stroje. Těsní se rotující díly, díly, které mají přímočarý posuv nebo navzájem se nepohybující díly.

### Těsnění pro rotující díly

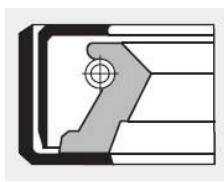

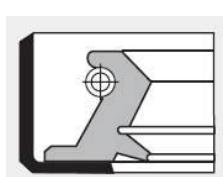

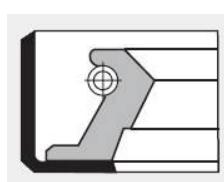

Gufero bez prachovky

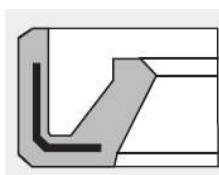

Gufero s prachovkou

Těsnění s jedním těsnícím břitem. Pryžový elastický vnější plášť eliminuje teplotní roztažnost a větší povrchovou drsnost úložného prostoru. Při častější výměně těsnění není nebezpečí poškození zástavbového prostoru. Typ je vhodný pro běžné utěsnění kapalných a plynných médií. Ochranná prachovka zabraňuje přístupu prachu a nečistot do vlastního těsnícího místa. Otěr na těsnění snižuje a korozi na hřidle zabraňuje mazací vazelína v prostoru mezi těsnícím břitem a prachovkou.

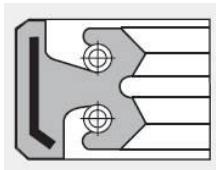

Těsnění s jedním těsnícím břitem. Kovové pouzdro umožňující při montáži snadnější uložení. Vyžaduje přesnější toleranci úložného prostoru, aby bylo dosaženo dokonalého utěsnění i na vnějším plášti.

Těsnění s jedním těsnícím břitem. Je opatřeno kovovým pouzdem a kovovou výztuží. Pro drsnější provozní podmínky a větší rozměry. Gufero je díky výztuži odolnější vůči chybám při montáži.

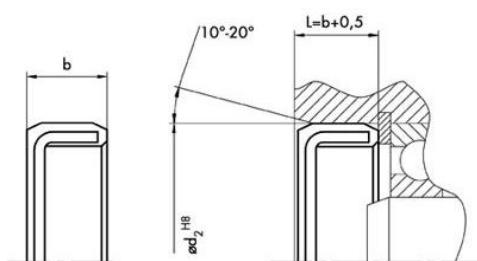

Těsnění s jedním těsnícím břitem. Gufera bez tažných pružinek určená pouze pro nenáročná použití. Gufera WAO mají vnější pryžový plášť.

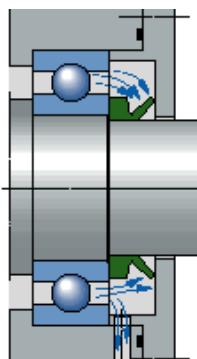

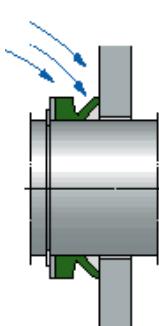

Těsnění se dvěma těsnícími břity k utěšňování dvou médií. Gufera WAD mají vnější pryžový plášť. Těsnění se čtyřmi břity jsou ještě účinnější. Mají nižší tření. Nahrazují těsnění se dvěma břity pro vyšší otáčky hřídele. Výroba ze vstřikovaného termoplastického elastomeru (TPE).

Axiální těsnění se používají především v kombinaci s radiálními těsnícími kroužky hřídele. Používají se jako modulární předřazený těsnicí prvek pro utěsnění před nečistotami, prachem, tukem a proti stříkající vodě z vnějšku. Axiální těsnění se skládají ze dvou složek - z kovového kroužku a z pryže.

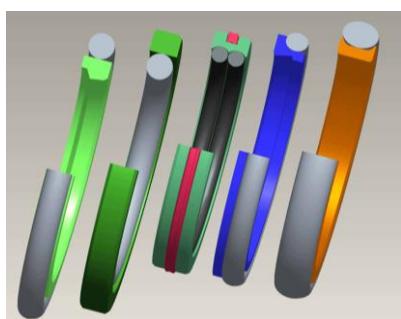

Těsnící víčko se používá pro bezpečné utěsnění otvorů pro hřídele. Často v převodovkách. Požadujeme chemickou odolnost vůči olejům a tukům. Střední odolnost proti stárnutí.

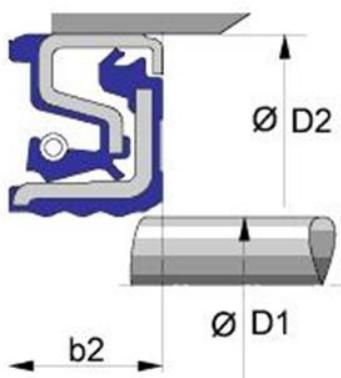

V-kroužky - celopryžová těsnění pro rotující hřídele s kuželovým těsnicím břitem. Montují se a otácejí s hřidelí. Těsnicí břit v axiálním směru těsní vůči stykové ploše, která je kolmá k hřideli. V-kroužky lze roztahnout a mohou být při montáži přetaženy i přes přírubu - výhoda při opravách. Při rychlostech od 8 do 12 m/s musí být axiálně pojistěny. Ochrana proti prachu, popř. stříkající vodě.

Jedna velikost V - kroužku může být použitá i pro více průměrů hřidelí.

Dvoudílné rotační těsnění (Omegat) se skládá z operného o-kroužku a PTFE tvarového těsnícího kroužku. Výhodou je možnost kombinace posuvného a rotačního pohybu, a možnost velkého tlakového zatížení těsnění.

Těsnící kroužky, které se dotýkají rotačních dílů, jsou při provozu zdrojem tepla. Z tohoto důvodu se u rychloběžných převodovek používá labyrint.

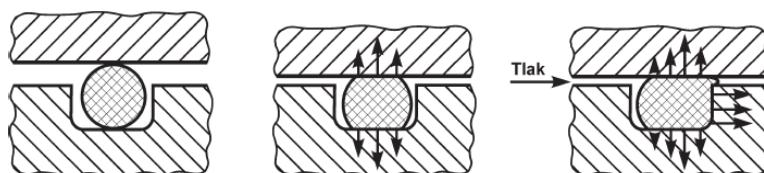

Kazetové těsnění je kompletní jednotka složená z radiálního hřídelového těsnění a protiběžného místa. Racionální řešení se zabudovaným labyrintem proti extrémnímu zatížení nečistotami. Zabudované protiběžné místo odpovídá vysokým požadavkům na dynamické těsnění. Výhodou tohoto těsnění je nenáročnost na opracování hřídele (i jeho možné použití pro poškozené hřídele) a je výrazně prodloužená životnost.

Obr. 4-7 Těsnění rotujících dílů [4, 7, 13, 17]

### Těsnění pro statická a dynamická použití

O-kroužky jsou vhodné pro těsnění vzájemně se nepohybujících částí (pod hlavou šroubu, utěsnění víka) nebo při vzájemném axiálním pohybu (píst a pístnice)

Obr. 4-8 Princip těsnění pomocí O-kroužku [16]

## 5. Návrh převodovky

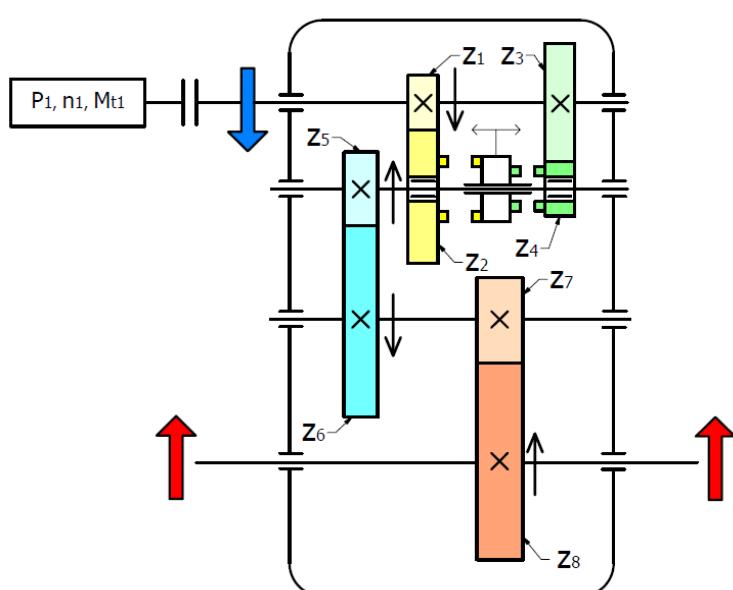

### 5.1. Rozdělení zatěžovacích stavů

Celková doba životnosti  $T$  je rozdělena v poměru 1:4 na dobu  $T_1$  a dobu  $T_2$ . Po dobu  $T_1$  bude převodovka zatížena na 100% výkonu; po dobu  $T_2$  bude zátěž 70%. Polovinu doby  $T_1$  i doby  $T_2$  bude tvořit reverzní chod (tj. 10 a 40%). V tomto okamžiku jde o 4 zatěžovací stavů. Spojkou na hřídeli II bude zařazen 1. nebo 2. rychlostní stupeň. Rozdělením 4 předchozích stavů dvěma rychlostními stupni dostavám osm zatěžovacích stavů.

100% zatížení	Celková doba provozu $T=2400$ hodin	Moment na vstupním hřídeli [kNm]	Moment na hřídeli II	
			Stupeň	[kNm]
1.	$T_1 = 2400 \cdot 0,2 = 480$	120	6	22,14
2.		120	-6	-22,14
3.		120	6	6
4.		120	-6	-6
70% zatížení	$T_2 = 2400 \cdot 0,8 = 1920$			
5.	480	480	4,2	15,5
6.		480	-4,2	-15,5
7.		480	4,2	4,2
8.		480	-4,2	-4,2

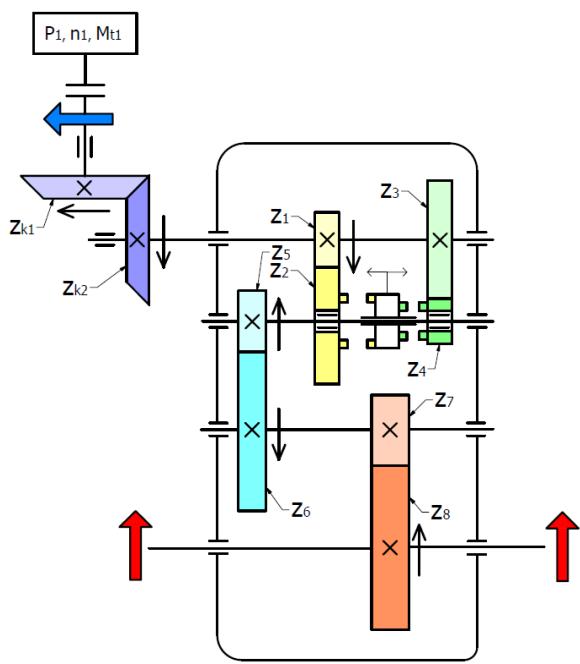

Motor zatím není specifikovaný. Vstupní točivý moment je  $M_t = 6000$  Nm

### 5.2. Varianty kinematických schémat

Obr. 5-1 Kinematické schéma převodovky typu C

Na základě požadavků zadavatele jsem sestavila návrh kinematického schéma pro typ převodovky C. Všechny hřídele mají vůči sobě navzájem rovnoběžnou polohu. Převodovka má mít dva převodové stupně. To je umožněno dvěma kinematickými cestami. Každá cesta je přes tři soukolí. Jedna kinematická cesta začíná vstupním hřídelem přes soukolí 1,2, soukolí 5,6 a soukolí 7,8 a končí výstupním hřídelem. Druhá kinematická cesta rovněž začíná vstupním hřídelem, ale pokračuje přes soukolí 3,4. Dále je shodná s předchozí cestou (tj. přes soukolí 5,6 a 7,8 na výstupní hřídel). O zařazeném stupni rozhoduje poloha přesuvné spojky.

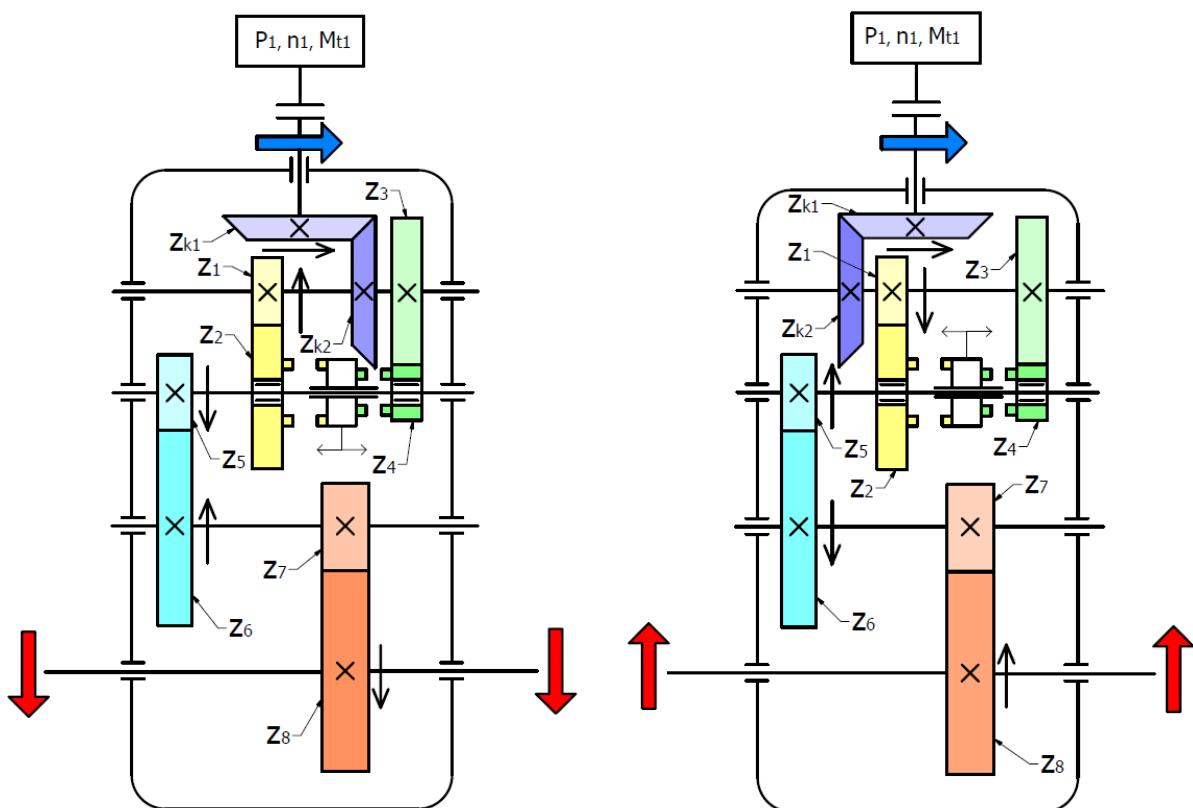

Obr. 5-2 Kinematické schéma převodovky typu KC s nakupovanou převodovkou

Z požadavku zadavatele na stejnou skříň pro oba typy převodovky vyplývá nutnost ponechání základu kinematického schéma převodovky typu C i pro převodovku typu KC, jejíž vstupní hřídel bude umístěný kolmo k výstupnímu hřídeli.

Kolmou polohu hřídel jsem se rozhodla vyřešit kuželovými koly s převodem 1:1.

Pro rychlou změnu vzájemné polohy hřídelů ze stejného výchozího základu by mohla sloužit nakupovaná převodovka, která by se umístila na současný vstupní hřídel (kinematické schéma je na Obr. 5-2). Tímto řešením by ale došlo k výraznému překročení určených orientačních obrysových rozměrů skříně a nebyl by ani dodržen požadavek na umístění osy vstupního hřídele do osy převodovky a dělicí roviny skříně.

Při dodržení požadavků na umístění vstupního hřídele se jeví jako možné umístění kuželového kola mezi kola 1 a 3 nebo před (viděno zleva) kolo 1 (viz Obr. 5-3).

Obr. 5-3 Možná umístění kuželového soukolí

### 5.3. Návrh modulů a počtu zubů

Kritéria vhodné volby druhu ozubení

- únosnost
- tuhost
- účinnost
- hlučnost
- tlumení

Pro větší únosnost a menší hlučnost volím na čelném ozubení šikmé zuby. Vztahy pro první návrhy ozubení

Informativní modul

$$m = 7,6 \cdot \sqrt[3]{\frac{M_t \cdot \cos \beta}{c \cdot \psi \cdot z_1}}.$$

$M_t = 6000 \text{ Nm}$

$c = 15$  (materiálová konstanta pro šlechtěnou ocel, tvrzené boky zubů)

$\psi = 20$  (volí se podle materiálu, pro tvrzené boky zubů v rozmezí 10 – 20)

$$m = 7,6 \cdot \sqrt[3]{\frac{6000 \cdot \cos 15^\circ}{15 \cdot 20 \cdot 17}} = 7,95$$

Volím modul  $m = 7$ .

$$a = \frac{d_1 + d_2}{2} = 295 \text{ [mm]}$$

$$d_1 = \frac{z_1 \cdot m}{\cos \beta} = \frac{17 \cdot 7}{\cos 15^\circ} = 123,198 \text{ [mm]}$$

$$d_2 = 2 \cdot a - d_1 = 2 \cdot 295 - 123,198 = 466,802 \text{ [mm]}$$

$$d_2 = \frac{z_2 \cdot m}{\cos \beta} \rightarrow z_2 = \frac{d_2 \cdot \cos \beta}{m} = \frac{466,802 \cdot \cos 15^\circ}{7} = 64,413 \doteq 64 \text{ zubů}$$

Bachův vzorec

$$F_{dov} = t \cdot b \cdot c \cdot 1,5; \quad b = \psi \cdot m$$

$$b = \psi \cdot m = 20 \cdot 7 = 140$$

$$F_{dov} = \pi \cdot 7 \cdot 140 \cdot 15 \cdot 1,5 = 69272 \text{ [N]}$$

Pro první soukolí volím počty zubů  $z_1 = 17$ ,  $z_2 = 64$ .

$$\text{Převod } i_1 = \frac{z_2}{z_1} = \frac{64}{17} = 3,7647$$

Z požadovaného celkového převodu 1. stupně zbyde

$$i = \frac{i_{c1}}{i_1} = \frac{54,485}{3,764} = 14,4753.$$

To je téměř stejná hodnota převodu jako u 2. stupně.

$$i_2 = \frac{i_{c2}}{i} = \frac{14,825}{14,475} = 1,024.$$

Moment  $M_t = 6000 \text{ Nm}$  je stejný jako u soukolí 1,2. Modul volím  $m = 7$ . Osovou vzdálenost musím rozdělit koly s převodem 1,024. Tedy zhruba na půl.  $295 / 2 = 147,5 \text{ [mm]}$ .

$$d_3 = \frac{z_3 \cdot m}{\cos \beta} = 2 \cdot 147,5 = \frac{z_3 \cdot 7}{\cos 15^\circ} \rightarrow z_3 = \frac{295 \cdot \cos 15^\circ}{7} = 40,7 \text{ [zubů]}$$

Upravím-li úhel  $\beta = 10^\circ$ , pak  $z_3 = 41,5$  zubů

Poměr  $z_4/z_3 = 41/40 = 1,025$ ,  
 $z_4/z_3 = 42/41 = 1,024$ .

Proto volím čelní ozubení se sklonem zubů  $\beta = 10^\circ$  a počty zubů  $z_4=42$ ,  $z_3=41$ .

Pro další soukolí se změní točivý moment  $M_{s1} = M_1 \cdot i_1 \cdot \eta_1 \text{ [Nm]}$

$$M_{s1} = 6000 \cdot \frac{z_2}{z_1} \cdot \eta_1 = 6000 \cdot \frac{64}{17} \cdot 0,98 = 22\,136,5 \doteq 22\,140 \text{ [Nm]}$$

$$m = 7,6 \cdot \sqrt[3]{\frac{M_t \cdot \cos \beta}{c \cdot \psi \cdot z_1}} = 7,6 \cdot \sqrt[3]{\frac{22140 \cdot \cos 15^\circ}{15 \cdot 20 \cdot 17}} = 12,25$$

Volím modul  $m = 12$ .

$$d_5 = \frac{z_5 \cdot m}{\cos \beta} = \frac{17 \cdot 12}{\cos 15^\circ} = 211,196 \text{ [mm]}$$

$$a = 455 \text{ [mm]} \quad d_6 = 2 \cdot a - d_5 = 2 \cdot 455 - 211,196 = 698,804 \text{ [mm]}$$

$$698,804 = \frac{z_6 \cdot m}{\cos \beta} \rightarrow z_6 = \frac{698,804 \cdot \cos 15^\circ}{12} = 56,25 \doteq 56 \text{ [zubů]}$$

Poměr  $z_6/z_5 = 56/17 = 3,294$ ; na poslední převod zbude 4,394.  
 $z_6/z_5 = 57/16 = 3,563$ ; na poslední převod zbude 4,063.

Volím počty zubů  $z_5=16$ ,  $z_6=57$ .

Pro třetí soukolí se změní točivý moment  $M_{s2} = M_{s1} \cdot i_2 \cdot \eta_2 \text{ [Nm]}$

$$M_{s2} = 22\,140 \cdot \frac{z_6}{z_5} \cdot \eta_2 = 22\,140 \cdot \frac{57}{16} \cdot 0,98 = 77\,296,3 \doteq 77\,300 \text{ [Nm]}$$

$$m = 7,6 \cdot \sqrt[3]{\frac{M_t \cdot \cos \beta}{c \cdot \psi \cdot z_1}} = 7,6 \cdot \sqrt[3]{\frac{77300 \cdot \cos 15^\circ}{15 \cdot 20 \cdot 17}} = 18,59$$

Volím modul  $m = 18$ .

$$d_7 = \frac{z_7 \cdot m}{\cos \beta} = \frac{17 \cdot 18}{\cos 15^\circ} = 316,795 \text{ [mm]}$$

$$a = 765 \text{ [mm]}$$

$$d_8 = 2 \cdot a - d_7 = 2 \cdot 765 - 316,795 = 1213,205 \text{ [mm]}$$

$$1213,205 = \frac{z_8 \cdot m}{\cos \beta} \rightarrow z_8 = \frac{1213,205 \cdot \cos 15^\circ}{18} = 65,10 \doteq 65 \text{ [zubů]}$$

Poměr  $z_8/z_7 = 65/17 = 3,294$ ; celkový převod by byl 44,176.  
 $z_8/z_7 = 65/16 = 4,063$ . Celkový převod bude požadovaných 54,485.

Výstupní moment bude  $M = M_{s2} \cdot i_3 \cdot \eta_3$  [Nm]

$$M = 77300 \cdot \frac{65}{16} \cdot 0,98 = 307750 \text{ [Nm]}$$

2. stupeň není tolik redukční, točivý moment bude menší, ozubení vypočítané pro 1.stupeň vyhoví.

## 5.4. Model návrhu

V této fázi návrhu jsem udělala 3D návrh soukolí, abych získala přehled o možnostech umístění kuželového soukolí. Samotná ozubená kola jsem modelovala podle údajů z Tab. 5-1 a pevnostně kontrolovala na hodnoty z Tab. 5-2. Používala jsem dva softwary, Autodesk Inventor Professional 2013 a KISSsoft 2013.

### 5.4.1. Softwary použité při řešení

#### KISSsoft 2013

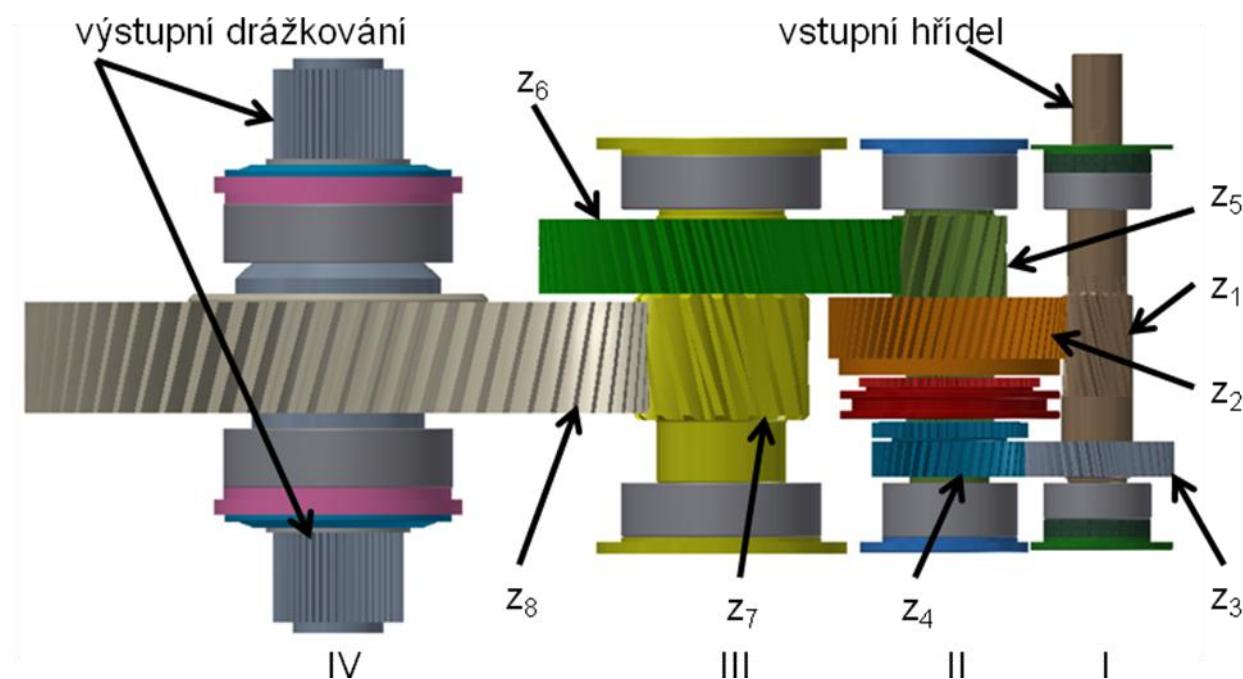

Software je určený pro výpočty. Výsledky výpočtů ozubení, hřidelů s ložisky a spojovacích prvků jsem zařadila do přílohy. Výsledná data jsem dále použila jako vstupy k analýzám provedeným v Inventoru.

Využila jsem skutečnost, že software dokáže vytvořit model navrhovaného počítaného dílu ve formátu \*.step. Tímto způsobem jsem získala model kuželového soukolí Klingelnberg pro další použití v Inventoru.

#### Autodesk Inventor Professional 2013

Software, který jsem použila pro vytvoření modelů jednotlivých částí, včetně ozubených soukolí, k pevnostní, tuhostní a modální analýze a k vytvoření výrobní dokumentace. Základ modelu kuželového soukolí jsem získala z KISSsoftu ve formátu \*.step. Inventor totiž umožňuje modelování ozubení s přímými a šikmými zuby, nikoli se zakřivenými.

K vytvoření 3D modelu prvního návrhu soukolí jsem použila Inventor.

Obr. 5-4 Sestavení prvního návrhu – varianta s rovnoběžným uspořádáním hřidel

Průměr hřidel jsem přizpůsobila pastorkům, délku hřidel požadované šířce skříně. Na vstupním hřideli je drážka pro pero. Pastorek 1 má ozubení ve větší šířce než spoluzabírající kolo 2. Je to z důvodu rozměrů výrobního nástroje. Na hřideli I je ještě nasazen pastorek 3, který zabírá s kolem 4. Soukolí 1,2 a 3,4 jsou stále v záběru. Kola 2 a 4 jsou uložena na kuličkových ložiskách a k přenosu momentu na druhý hřidel dojde po zasunutí ozubení

spojky, která se pohybuje axiálně po drážkováném hřídeli. Poloha spojky rozhoduje o celkovém převodu. Lze nastavit 2 převodové stupně. K přenosu momentu a tím i k zařazení převodového stupně a otáčení hřídele II dojde po zasunutí zubů přesuvné spojky (na Obr. 5-4 má červenou barvu) bud' do kola 2, nebo na kolo 4. Spoluzabírající část spojky je přišroubována ke kolu a má přímé zuby. Hřídel IV je delší, přesahuje plánovaný obrys skříně a je na obou koncích opatřen drážkováním.

Existují tedy 2 kinematické cesty, každá přes 3 soukolí.

1. rychlostní stupeň je dosažen přes převody  $z_2/z_1$ ,  $z_6/z_5$  a  $z_8/z_7$
2. rychlostní stupeň je dosažen přes převody  $z_4/z_3$ ,  $z_6/z_5$  a  $z_8/z_7$

Pro změnu vzájemné polohy vstupního a výstupního hřídele z rovnoběžné na kolmou jsem zvolila kuželové soukolí Klingelnberg s převodem 1:1.

Obr. 5-5 Umístění vstupního hřídele pro typ C a typ KC

Z Obr. 5-5 je patrné, že při respektování požadavku zadavatele na umístění osy vstupního hřídele v podélné ose skříně a zároveň v dělicí rovině převodovky je možná jen jedna varianta umístění kuželového soukolí. Pro řešení s kuželovým kolem mezi koly 1 a 3 není v modelu volný prostor. Došlo by ke kolizi s přesouvací spojkou.

Na přání zadávající firmy jsem z důvodu dosažení vyšší tuhosti hřídelů provedla úpravy. Následující postup návrhu a kontroly jednotlivých souhmotí je uveden pouze pro upravené řešení.

## 6. Návrh a kontrola jednotlivých souhmotí s využitím programu KISSsoft

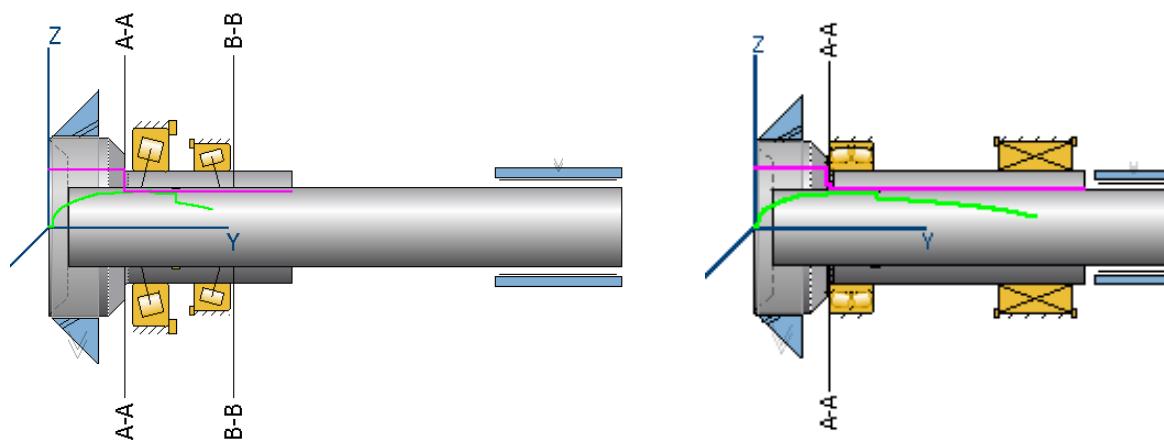

### 6.1. Soukolí

Původní návrh kuželového soukolí Klingelnberg jsem dělala pomocí programu Inventor Professional 2013, který nezohledňuje zakřivený tvar zubů. Za pomoci softwaru KISSsoft jsem z důvodu zadírání u soukolí změnila počet zubů z 24 na 32 a šířku  $b$  z 95 mm na 82 mm. Změny čelních soukolí oproti původnímu návrhu vyplynuly ze zadavatelem požadované vyšší tuhosti hřídelů při nutnosti zachování osových vzdáleností. Soukolí 1,2 jsem upravila z převodu 64/17 na 71/23, soukolí 3,4 z převodu 42/41 na 58/57. Ostatní soukolí zůstala beze změny. Výstupy z výpočtů jednotlivých soukolí jsou uvedeny v příloze.

Ozubená kola budou vyrobena z materiálu 18CrNiMo7-6, což je středně legovaná ušlechtělá chrom-nikl-molybdenová ocel k cementování. Tento materiál je vhodný pro velmi namáhané strojní součásti s cementovaným povrchem. Cementovaná vrstva po tepelném zpracování dosahuje na povrchu tvrdosti 62 až 64 HRC, zatímco jádro cementované součásti je i při relativně vysoké pevnosti značně houževnaté. Přísada molybdenu zvyšuje prokalitelnost; ocel prokaluje do hloubky přibližně 60 mm. Je vhodná pro dynamicky namáhané součásti.

### 6.2. Hřídele

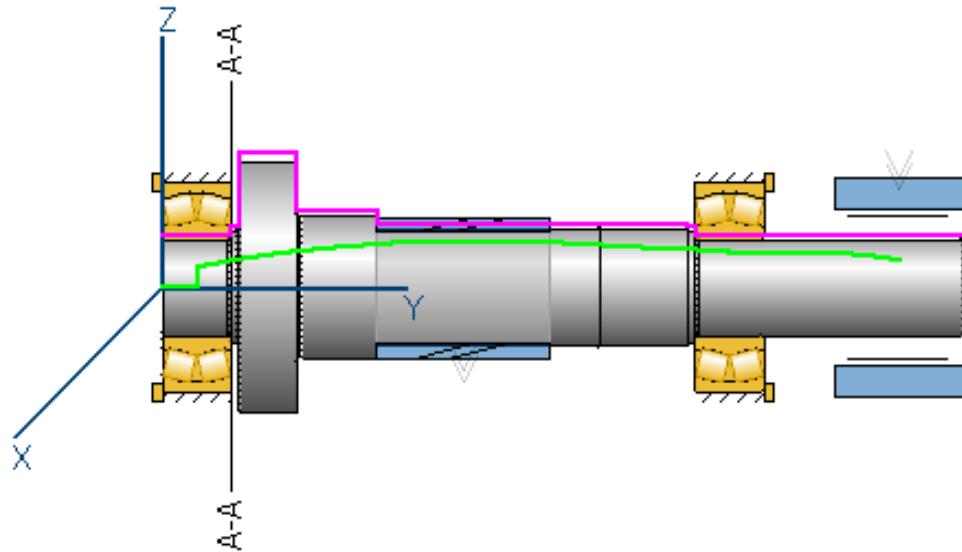

V návrhu hřídele 0 (zajištění kolmé polohy vstupního a výstupního hřídele) jsem uvažovala dvě možná uložení; se dvěma kuželkovými ložisky SKF 30228 J2 a SKF 32028 X, nebo s dvouřadým soudečkovým ložiskem SKF\*23030 CC/W33 a párovým kuželkovým ložiskem v provedení čely k sobě SKF 32030 X/DF. Obrys pro případné modifikování velikosti z hlediska dimenzování na pevnost (nastaveno redukované napětí 100 MPa) se na obrázcích zobrazuje jako zelená čára, pro dimenzování z hlediska ohybu (nastaven průhyb 0,1 mm) jako čára v barvě magenta (purpurová).

Obr. 6-1 Varianta uložení Hřídele 0  
se dvěma kuželkovými ložisky  
na soudečkovém a párovém kuželkovém ložisku

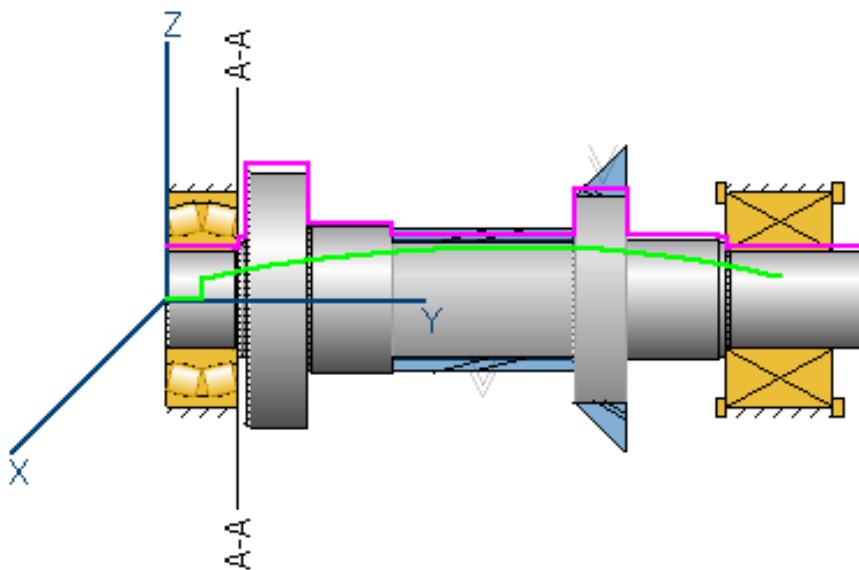

U hlediska montáže bude lepší uložení varianta s použitím soudečkového a párového kuželkového ložiska.

Hřídel I jsem počítala také ve dvou variantách. První varianta pro převodovku typu C uvažuje převislý konec hřídele pro připojení motoru z boku skříně. Je uložen ve dvou dvouřadých soudečkových ložiskách SKF\*22322E.

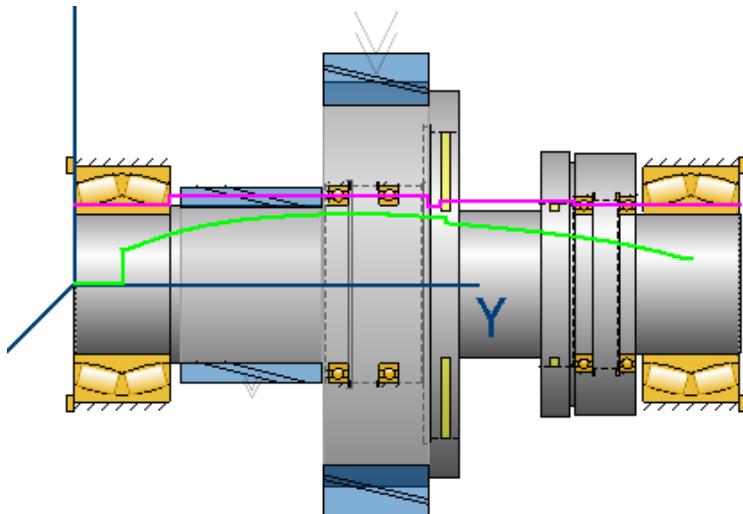

Obr. 6-2 Varianta Hřídele I pro rovnoběžné uspořádání hřídelů

Druhá varianta Hřídele I je pro typ převodovky KC (vstupní a výstupní hřídel k sobě kolmé). Levé ložisko je dvouřadé soudečkové SKF\*22322E. Na hřídeli přibylo kuželové kolo a to si vynutilo použití párového kuželíkového ložiska Koyo 46T 30322 JR/93 (v provedení zády k sobě)

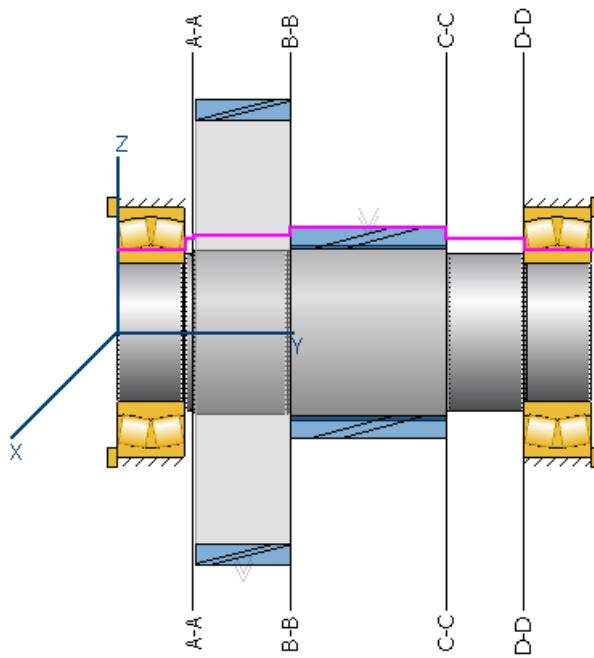

Obr. 6-3 Varianta Hřídele I pro kolmé uspořádání hřídelů

Při konzultaci po prvním návrhu požadoval zadavatel z důvodu případných modifikací ozubení větší tuhost Hřídele II tak, aby koeficient  $K_{H\beta}$  u pastorku dosahoval hodnoty v rozsahu 1,1 – 1,3. Výpočetový model se stavem po změnách obsahuje pastorek (5), větší kolo (2) uložené na dvou vnitřních kuličkových ložiskách SKF 61836, menší kolo (4) uložené na dvou kuličkových ložiskách SKF 61832. Samotný hřídel je uložen na dvou soudečkových ložiskách SKF\*24132 CC/W33. Spojka je zjednodušena na dva spojovací elementy. Zjednodušený výpočetový model je na Obr. 6-4.

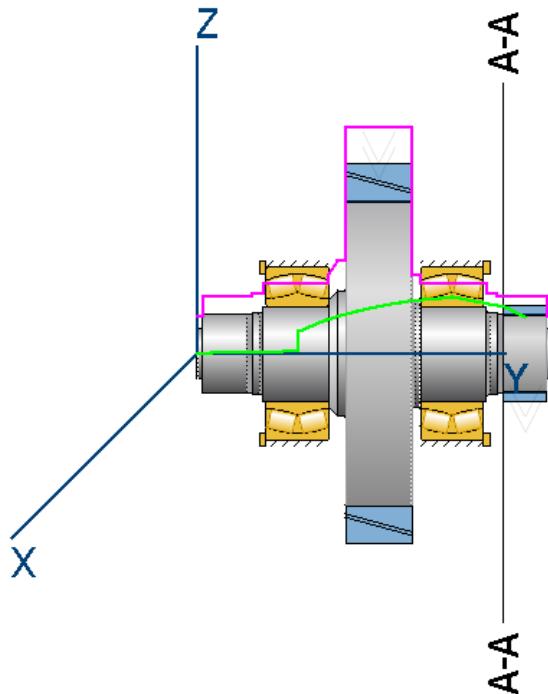

Obr. 6-4 Hřídel II

Hřídel III nese kolo (6) a pastorek (7). Je uložen na dvou kuželíkových ložiskách SKF\*22244 CC/W33.

Obr. 6-5 Hřídel III

Hřídel IV jsem také z důvodu větší tuhosti upravila. Nově má větší průměr, což se neprojeví na kole, ale na uložení a drážkování na koncích hřídele. Hřídel je uložen na dvou kuželkových ložiskách SKF\*23268 CA/W33

Obr. 6-6 Hřídel IV

Při výpočtech jsem nejprve uvažovala zatěžovací stavy (i reverzní). Pak jsem určila první čtyři vlastní frekvence souhmotí hřídelů, které jsem později použila při posouzení možného ovlivnění vlastní frekvence skříně. Výsledky výpočtů jsou v příloze.

### 6.3.Spojovací prvky

#### Pero

Výpočet pera pro přenos momentu z kola na hřídel je v příloze. Software KISSsoft upozorňuje, že materiálové vlastnosti oceli 18CrNiMo7-6 jsou dané pouze orientačně:  $R_m = 600 \text{ MPa}$ ,  $R_p = 425 \text{ MPa}$ ,  $E = 2,06 \cdot 10^5 \text{ MPa}$ ,  $\rho = 7830 \text{ kg/m}^3$ .

Nepodařilo se mě získat lépe vypovídající hodnoty. Dodavatel (Tab. 6-1) uvádí hodnoty jen do průměru 100 mm. Firma Poldi dodává i větší průměry, ale na svých stránkách materiálové vlastnosti uvádí jen slovně.

Mechanické vlastnosti v jádře referenčního vzorku po kalení a popuštění při 150–200 °C (uvedené hodnoty nejsou součástí EN 10084) <sup>1)</sup>	Průměr mm	Rp0,2 min MPa	Rm MPa

	50 < d ≤ 100	490	685 – 980

Tab. 6-1 Mechanické vlastnosti oceli udávané dodavatelem [10]

## Drážkování

Drážkování jsem použila k přenosu točivého momentu na hřídel II (přesuvná spojka) a na koncích výstupního hřídele. Výpočty jsou v příloze.

## Nalisování

Nalisováním jsou upevněna kola 2, 6 a 8. Výsledky výpočtů jsou přiloženy v příloze.

## 7. Upravená geometrie

Na základě požadavku zadavatele na větší tuhost hřídelů z důvodu modifikace ozubení a s využitím výpočetního programu KISSsoft jsem změnila geometrii ozubení soukolí 1,2 a soukolí 3,4.

Tab. 7-3 Upravená geometrie (vyznačená tučně); vzájemná poloha hřidelů kolmá

Změněná geometrie ovlivní parametry převodovky. Bud' budu chtít ponechat stejný motor (a tím klesne moment na výstupu), nebo budu požadovat na výstupu stejný moment jako u vzájemně rovnoběžné polohy vstupního a výstupního hřídele (a to vyvolá potřebu jiného motoru nebo použití motoru s regulací výkonu). Při volbě motoru je třeba vědět také údaje o napájecí frekvenci. Naše přenosová soustava pracuje s kmitočtem sítě 50 Hz, ale v zámoří, odkud zřejmě bude koncový zákazník vzhledem k určení převodovky, využívají kmitočet 60 Hz.

**Tab. 7-6 Porovnání čtyř sledovaných parametrů**

Na příkladu třífázového asynchronního motoru nakrátko je patrné, jak kmitočet ovlivní výkon, jmenovité otáčky a moment.

**Obr. 7-1 Vzhled motoru**

Třífázový asynchronní motor nakrátko je určen k pohonu průmyslových zařízení, např. ventilátorů, čerpadel, obráběcích strojů, lisů apod. Lze je používat pro prostředí mírného klimatu, ve zvláštních provedeních i v jiných klimatických podmínkách. K širšímu průmyslovému využití a rozšíření aplikačních možností v elektrických pohonech pracovních strojů a zařízení jsou řady asynchronních motorů s kotvou nakrátko odvozeny modifikované řady a speciální provedení motorů.

## 8. Porovnání převodovky typu C, typu KC se stejným motorem a typu KC se stejným výstupním momentem

Každá z provedených kinematických změn má vliv na změnu výkonu.

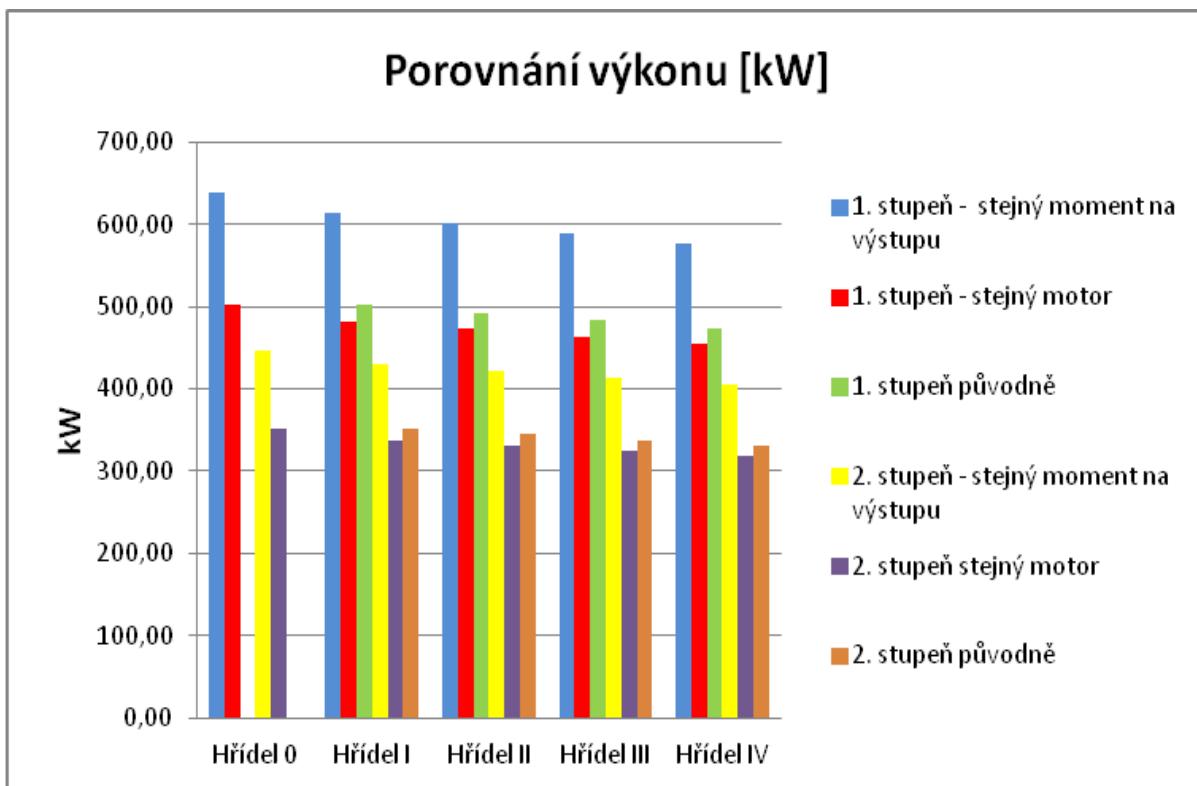

V Grafu 1 jsou znázorněny hodnoty výkonu na jednotlivých hřídelích. Převodovka má dva převodové stupně. Barevné sloupce ilustrují rozdíly mezi původní převodovkou typu C a dvěma pohledy na převodovku typu KC.

### Význam barev v grafu

Postupně z leva je použitá barva u každého hřídele nejprve pro 1. převodový stupeň modrá pro převodovku KC s požadavkem stejného momentu na výstupu, červená pro převodovku KC s ponechaným stejným motorem, zelená je první návrh pro převodovku typu C.

Následují hodnoty pro druhý stupeň. Žlutá pro převodovku typu KC s požadavkem na zachování stejného momentu jako u typu C, fialové jsou hodnoty pro případ stejného motoru na vstupu a hnědá barva znázorňuje výkon převodovky typu C.

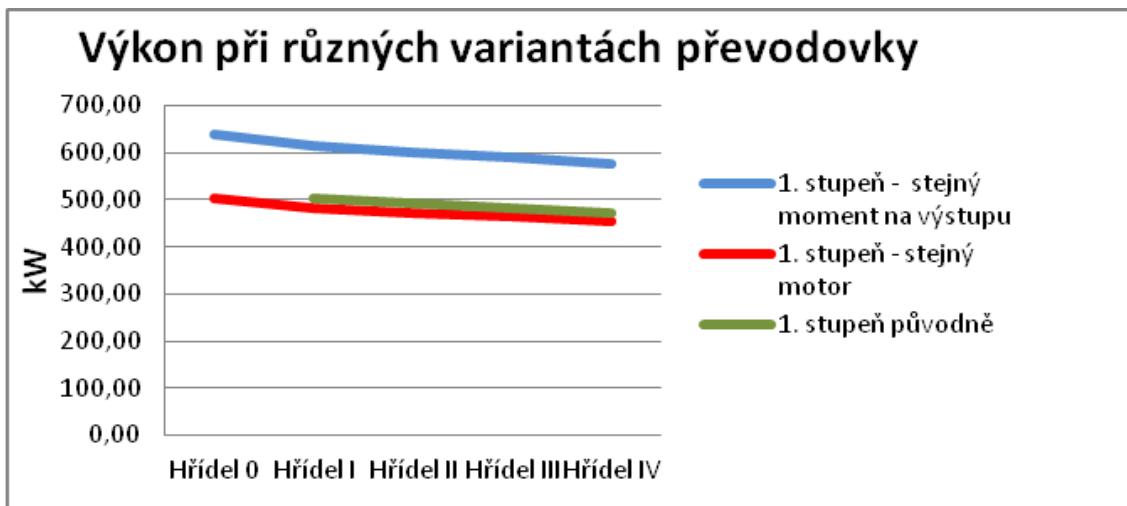

U hřídele 0 zelený a hnědý sloupec chybí. Je to proto, že v převodovce typu C hřídel 0 není.

Graf 1 Porovnání výkonu na jednotlivých hřídelích pro různá řešení převodovky

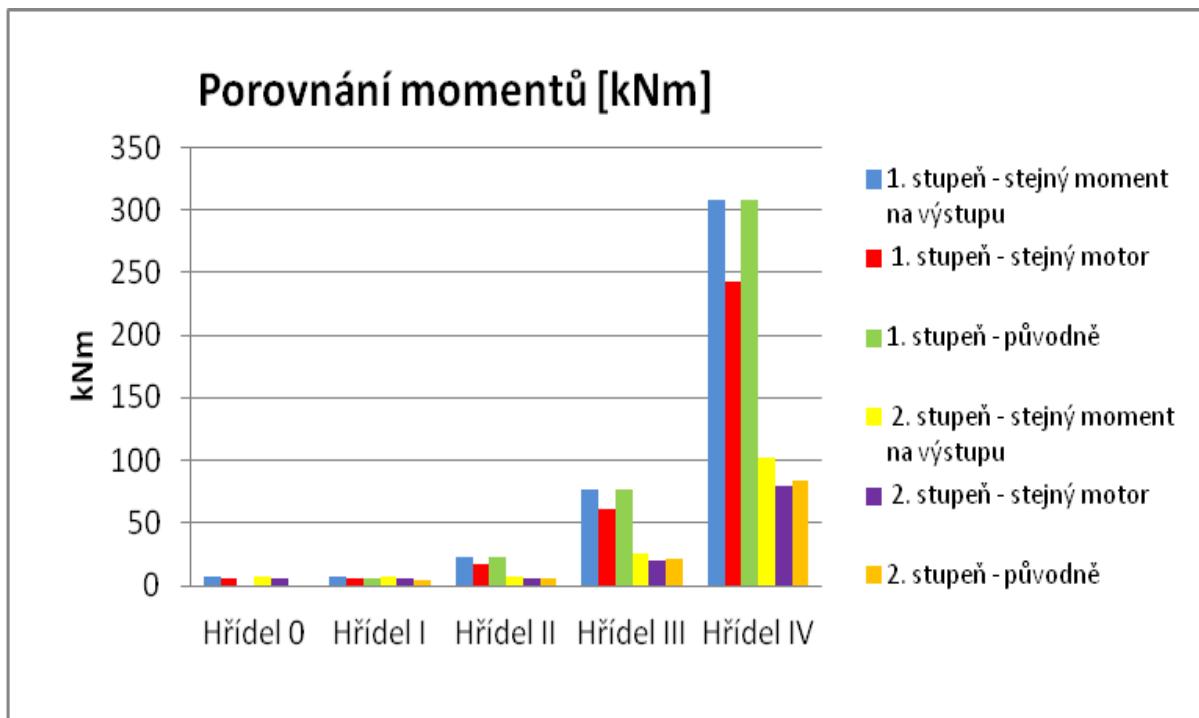

Celkově vidíme největší rozdíly výkonu u 1. převodového stupně (s větší redukcí otáček) mezi požadavkem na stejný motor a požadavkem na stejný výstupní moment. Na poklesu výkonu se podílí vložení kuželového soukolí asi čtyřmi procenty a změna geometrie vyvolaná požadavkem větší tuhosti asi dvacetí pěti procenty. Kdybychom tedy chtěli, vzhledem k použití převodovky pro naviják lan, zachovat stejný výstupní moment, jako má původní rovnoběžné uspořádání hřídelů, vedlo by to pravděpodobně k potřebě jiného motoru.

V následujícím grafu jsou stejná data jako v grafu 1 vykreslena jako spojitý pokles výkonu původního řešení převodovky typu C a poklesy převodovky typu KC. Pro lepší názornost je uveden jen první převodový stupeň a barvy jsou stejné jako v grafu 1. Zelený graf začíná opět až u hřídele I, protože původní převodovka typu C hřídel 0 nemá.

Graf 2 Pokles výkonu pro 1. převodový stupeň v závislosti na typu převodovky

Při porovnání z hlediska momentů, je z grafu 3 vidět zřetelný pokles momentu na výstupním hřídeli IV při stejném motoru na vstupu oproti požadavku na stejný výstupní moment. Zelený a oranžový sloupec u Hřídele 0 nejsou; převodovka typu C Hřídel 0 neobsahuje.

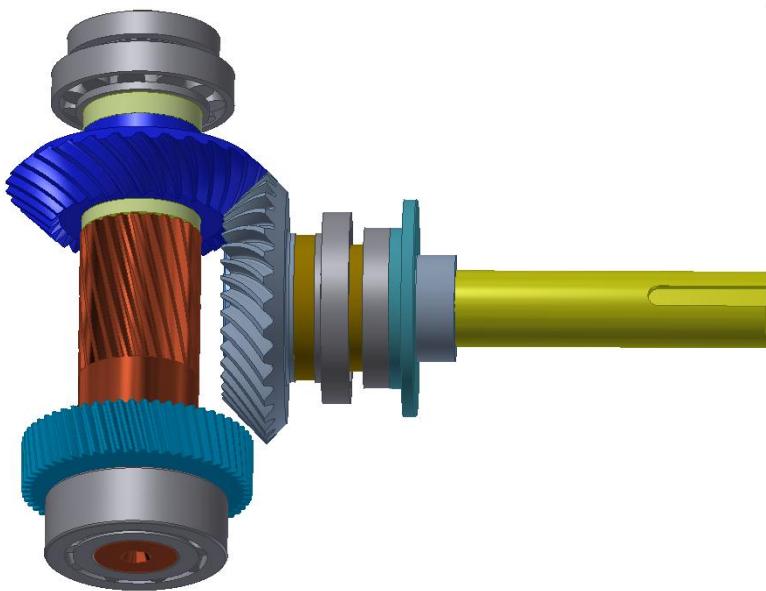

Graf 3 Točivé momenty v závislosti na typu převodovky

Převodovka typu KC má, při zachování stejného motoru na vstupu jako u převodovky typu C, nižší výstupní točivý moment. Vložení kuželového soukolí se podílí na poklesu cca 4%, vlivem upravené kinematiky čelních ozubení jde o pokles o dalších cca 25%.

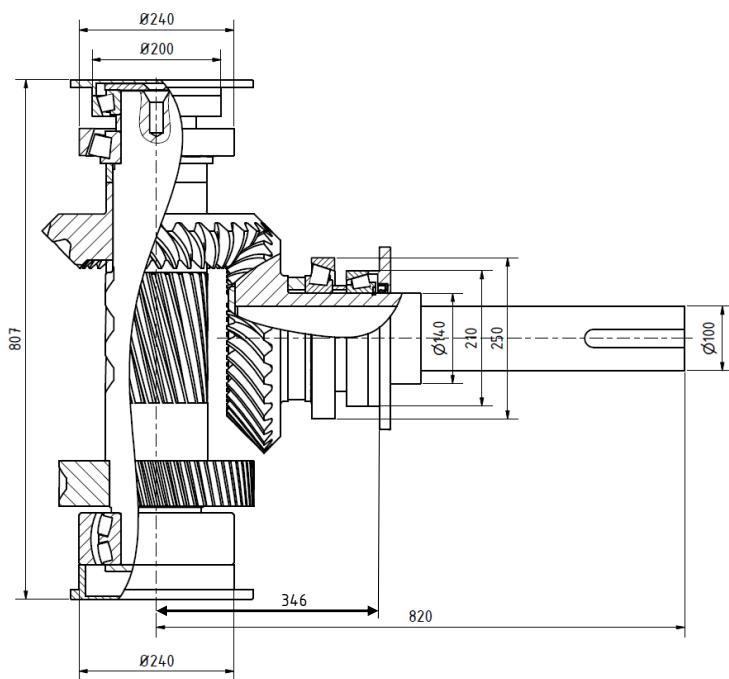

## 9. Modely soukolí ve 3D

3D modely jsem získala pomocí softwaru Inventor Professional 2013. Jsou modelovány pro nejméně příznivý zatěžovací stav, tj. respektování stejného momentu na výstupu pro převodovku typu C a KC. Inventor neumožňuje výpočet ani modelování kuželového soukolí Klingelnberg, proto jsem převzala model kuželového soukolí ve formátu \*.step z KISSsoftu.

Na následujícím obrázku modelu kuželového soukolí je vstupní hřídel v kolmém poloze ke zbylým hřídelům, kuželové soukolí Klingelnberg s převodem 1:1, pastorky 1 a 3.

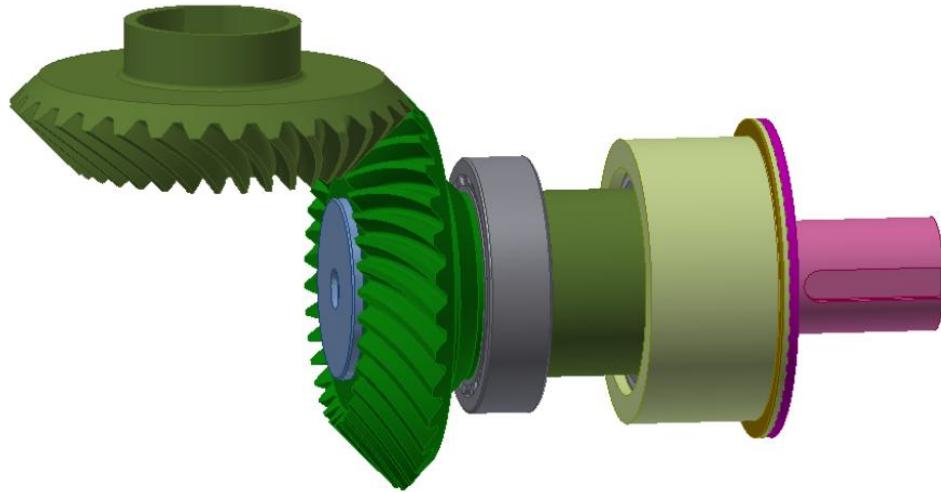

Obr. 9-1 3D model kuželového soukolí Klingelnberg;  
na Hřídeli 0 dvě kuželíková ložiska

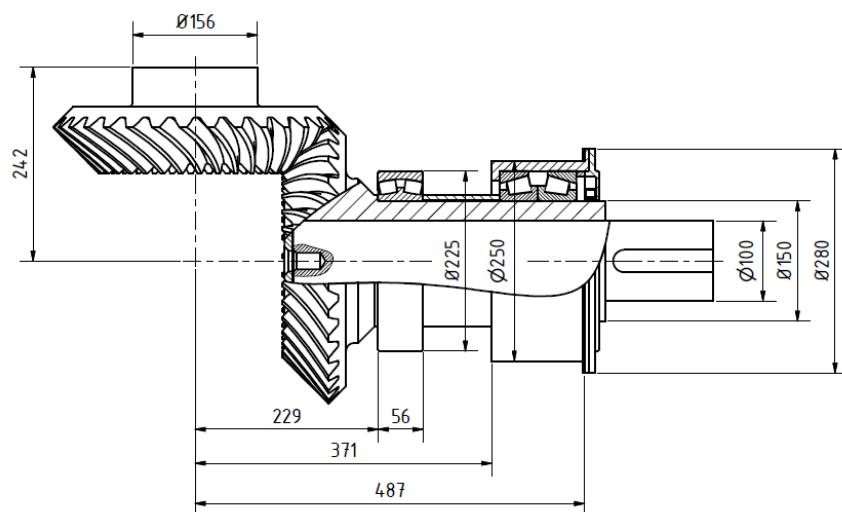

Obr. 9-2 Kuželové soukolí

Ustavování kuželových kol do záběru bude snazší, když bude kuželový pastorek uložen pomocí soudečkového a párového kuželíkového ložiska, jak je tomu na Obr. 9-3. Je to ale náročnější z pohledu potřebného prostoru. Celkové rozměry skříně s různým uložením hřídelů jsou srovnány v této práci později.

na Hřídeli 0 je soudečkové a párové kuželíkové ložisko

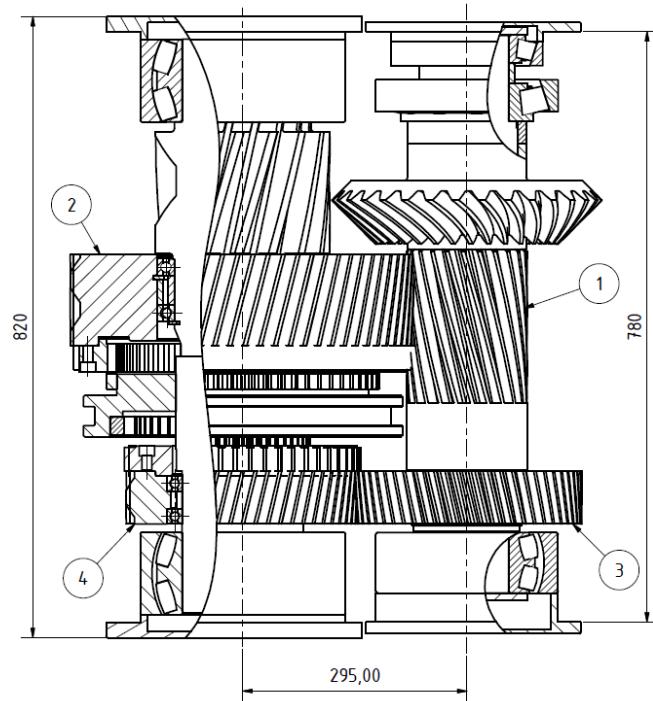

Obr. 9-4 Kuželové soukolí se soudečkovým a párovým kuželíkovým ložiskem

Na Obr. 9-5 je hřídel I s kuželovým kolem pro převodovku typu KC. Součástí hřídele je pastorek 1. Na hřídel je také nasazeno kolo 3. Na hřídeli II jsou kola 2 a 4 a přesouvací spojka. Na kolech 2 a 4 jsou přišroubovány čelní ozubené objímky s přímými zuby, které střídavě, podle zařazeného převodového stupně, jsou a nejsou v záběru s ozubením spojky.

Obr. 9-7 3D model soukolí 5,6

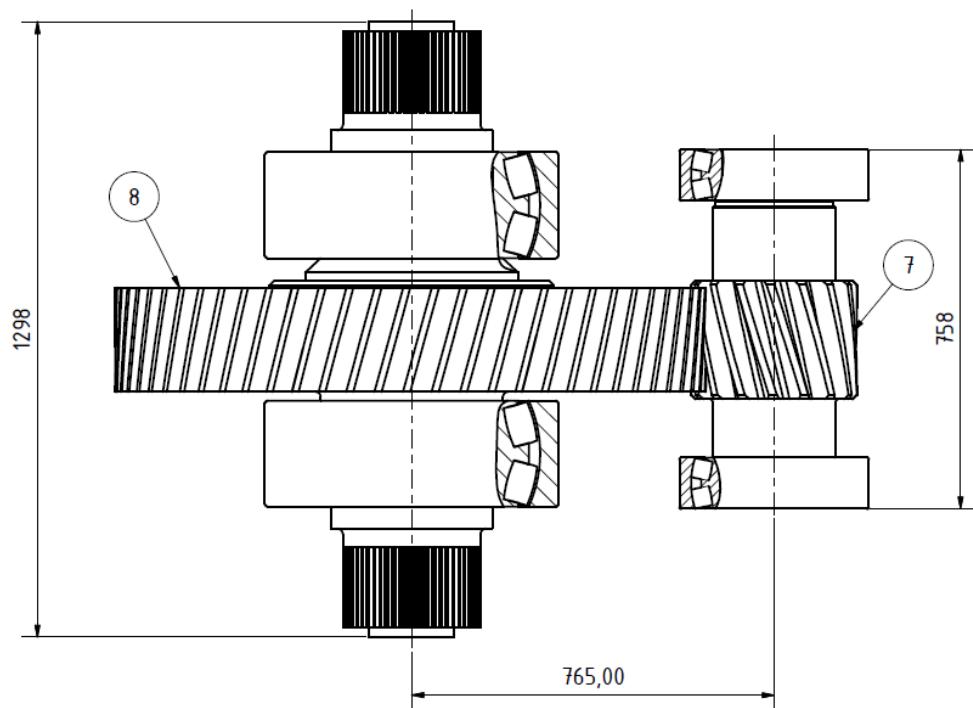

Obr. 9-8 Osová vzdálenost soukolí 5,6

Posledním převodem převodovky je soukolí 7,8 na Obr. 9-9. Výstupní hřídel, na kterém je nasazeno kolo 8, přesahuje souměrně obrysou skříně. Jeho oba konce jsou opatřeny drážkováním.

## 9.1. Původní řešení

Na Obr. 9-11 je původní návrh převodovky v univerzální skříni před úpravami. Nahoře je typ C. Otvor pro kolmý vstupní hřídel je zakrytý víčkem. Na dolním obrázku je otvor využitý pro vstupní hřídel pohánějící kuželové soukolí.

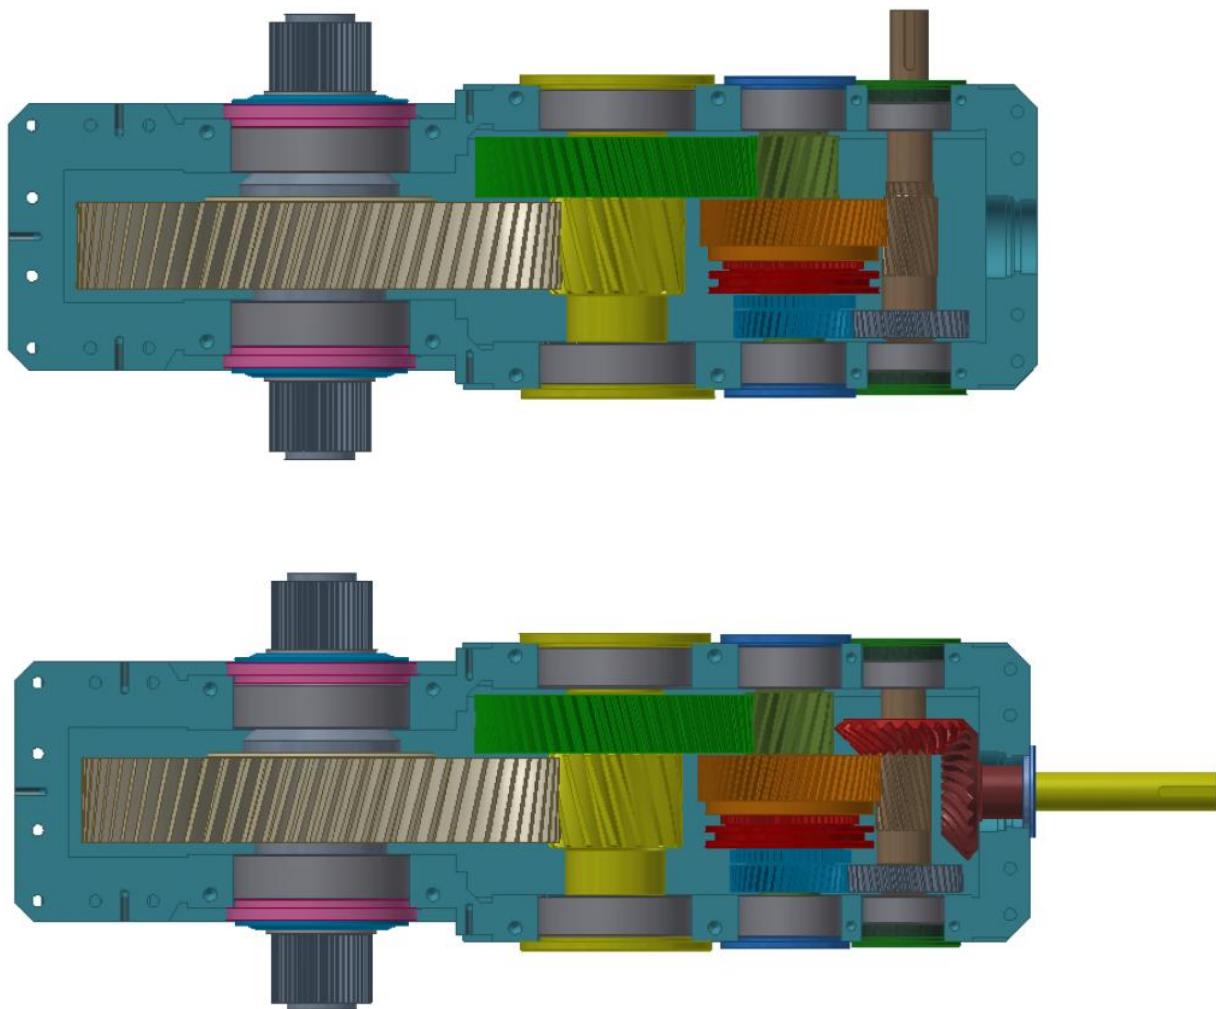

Obr. 9-11 3D model původního návrhu univerzální skříně

Na 3D modelu bez víka je na dolním obrázku oproti hornímu navíc kuželové soukolí a kolmý vstupní hřídel.

Obr. 9-12 Původní návrh univerzální skříně bez víka

Na Obr. 9-13. je pohled do dělicí roviny převodovky typu C a převodovky typu KC.

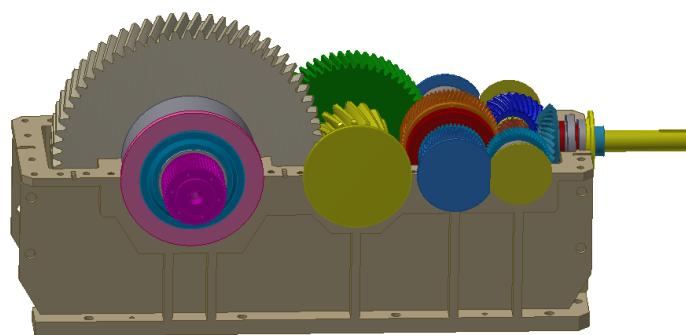

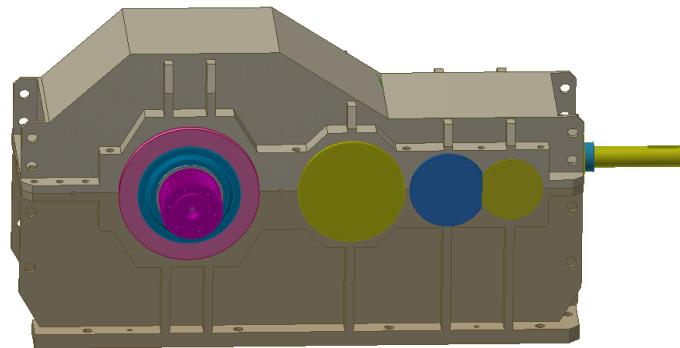

Obr. 9-13 Pohled do dělicí roviny obou typů převodovky při původním návrhu

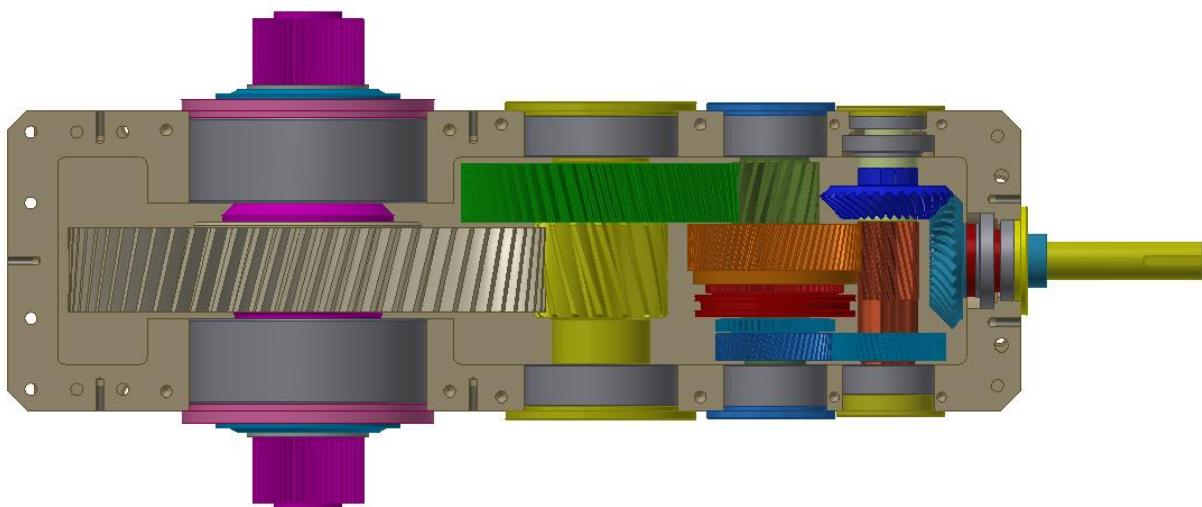

Tento návrh nesplnil přání zadavatele ohledně tuhosti hřídelů.

## 9.2. Převodovka upravená dle požadavků na tuhost

Po požadovaném zvětšení tuhosti prvního a čtvrtého hřídele a změně velikosti ložisek jsem upravila rozměry skříně. Na Obr. 9-14 je 3D model upravené převodovky, na Obr. 9-15 je pohled do dělicí roviny této upravené převodovky. Oproti původnímu návrhu jsou i jiná čelní soukolí 1,2; 3,4 a kuželové soukolí.

Obr. 9-15 Pohled do dělicí roviny upravené převodovky typu KC

### 9.3.Upravená převodovka s jiným uložením vstupního hřídele

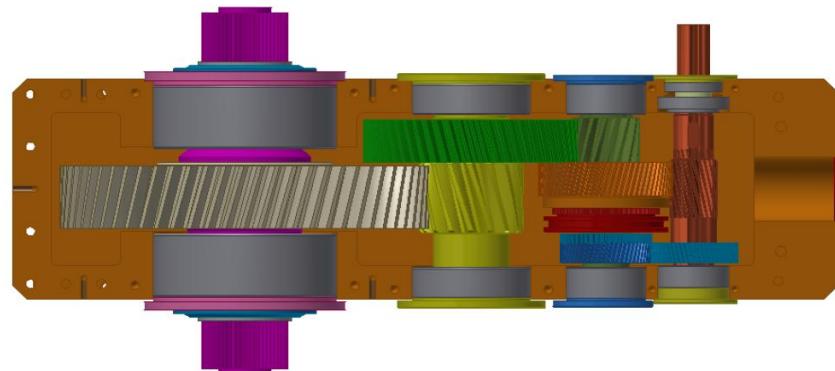

Následující návrh vychází z tuhostně zesíleného (upraveného) návrhu, ale uložení vstupního hřídele je s ohledem na snazší montáž řešeno soudečkovým ložiskem spolu s párovým kuželíkovým ložiskem. Uvedená varianta je z hlediska uložení nejlepší, ale nedodržuje obrysové rozměry skříně uvedené zadavatelem.

- Návrh po upravení tuhosti hřídelů

- Návrh po upravení tuhosti hřídelů a po změně uložení vstupního hřídele

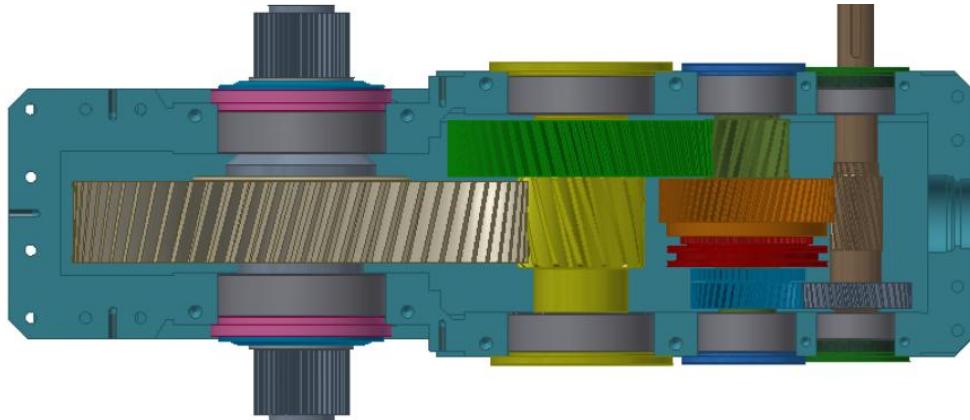

Obr. 9-19 Rozměry jednotlivých návrhů

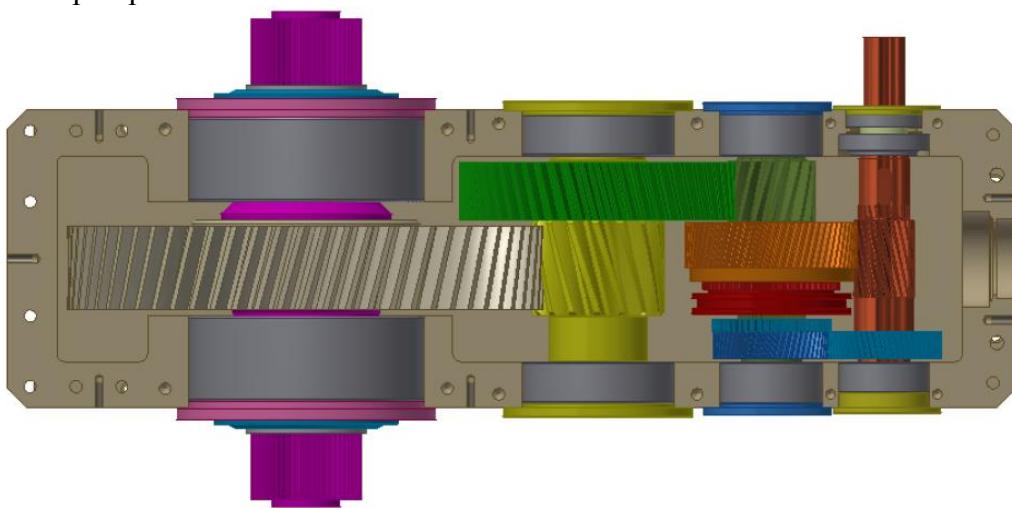

Řešení, které vyhovuje tuhostně a bude u něj snadněji probíhat montáž kuželového soukolí, má ze všech variant největší obrysové rozměry.

## 9.5. Pohled do dělicí roviny variant převodovky typu C

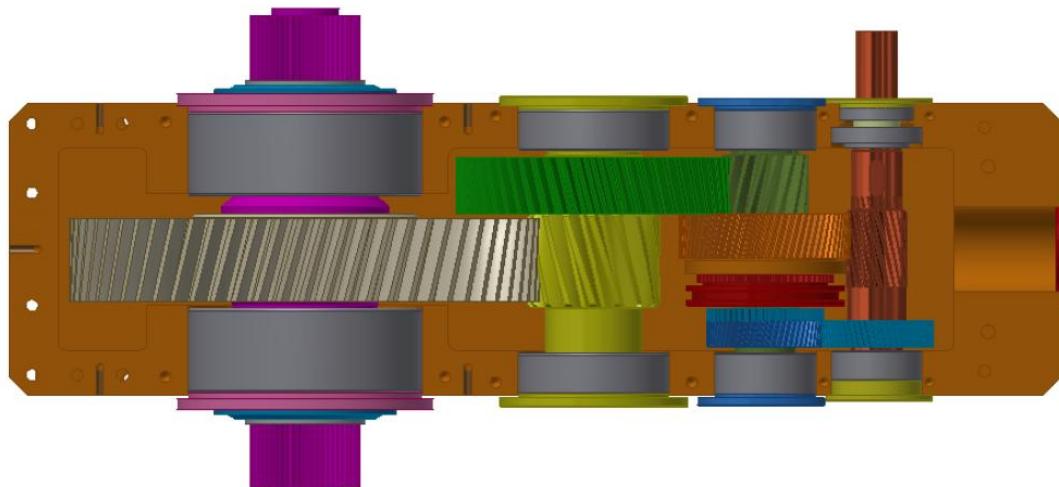

- Původní návrh

- Návrh po upravení tuhosti hřídelů a po změně uložení vstupního hřídele pro typ KC

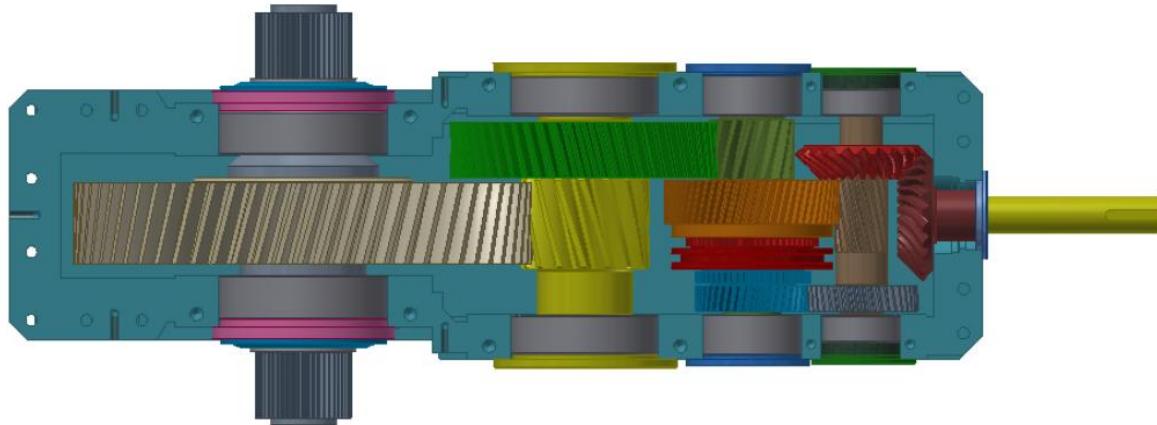

Obr. 9-20 Pohled do dělicí roviny modelu převodovky typu C jednotlivých návrhů

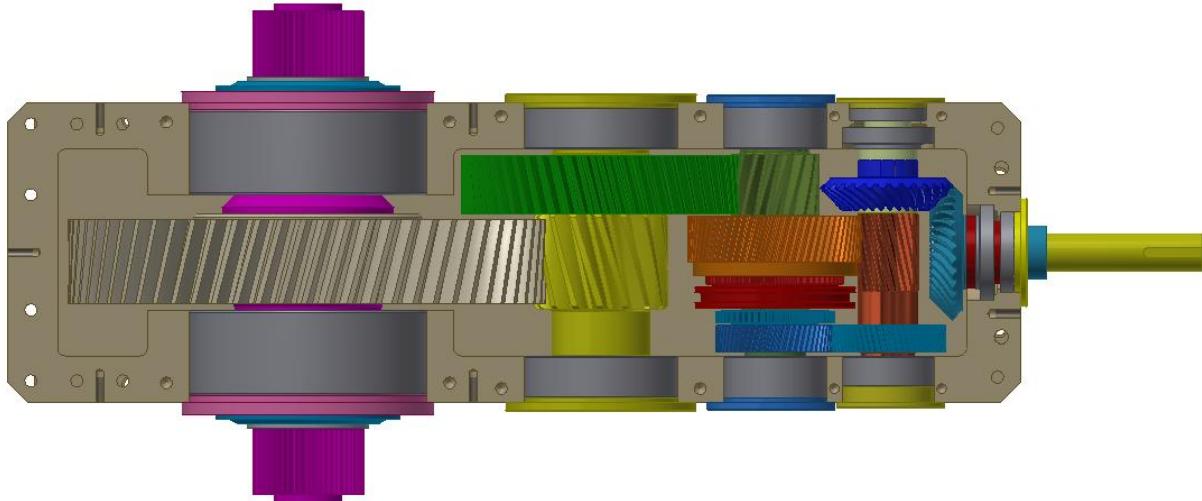

Na pohledech po upravení tuhosti hřídelů jsem zesílené hřídele I a IV barevně odlišila od původního řešení.

## 9.6. Pohled do dělicí roviny variant převodovky typu KC

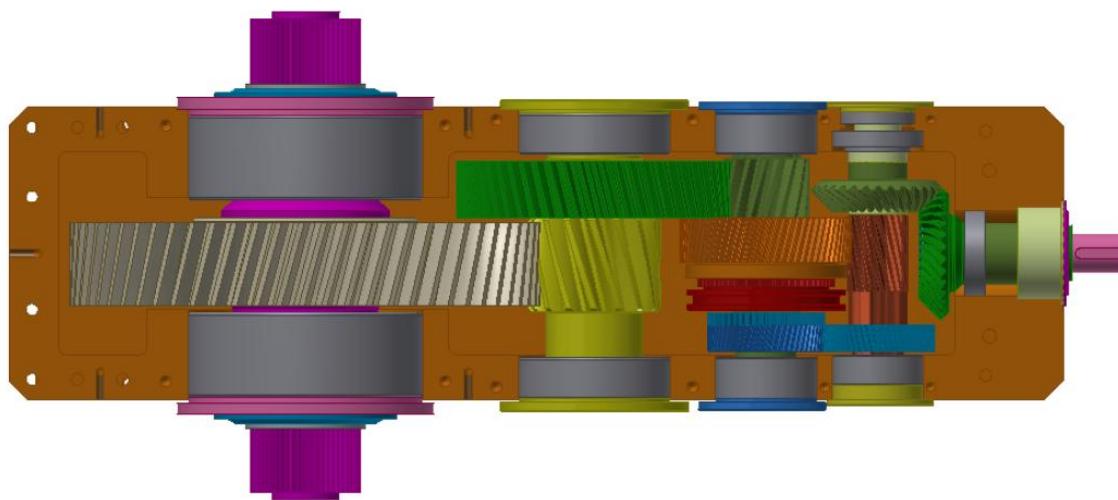

- Původní návrh

- Návrh po upravení tuhosti hřídelů a změně počtu zubů kuželového soukolí

- Návrh po upravení tuhosti hřídele a uložení vstupního hřídele u typu KC

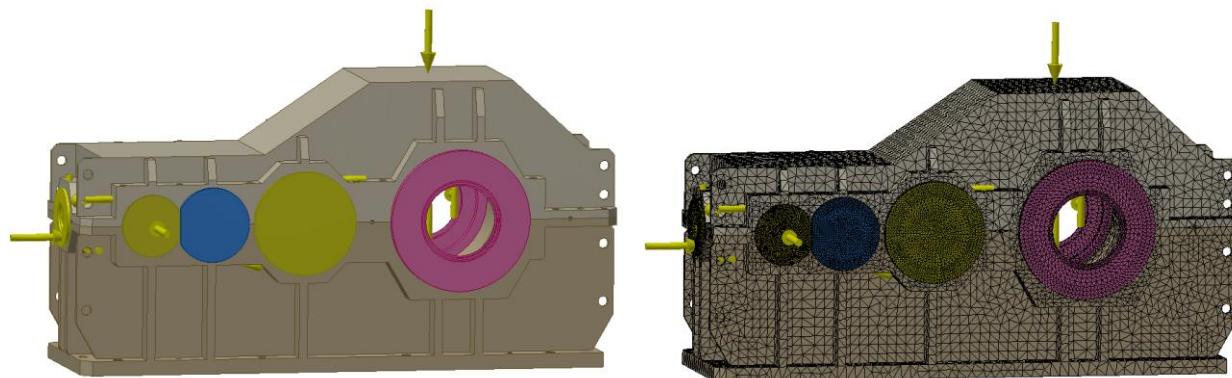

Obr. 9-21 Pohled do dělicí roviny převodovky typu KC jednotlivých návrhů

Kuželové soukolí je v každém návrhu jiné. V původním má 24 zubů. V dalších návrzích je shodně po 32 zubech, ale vstupní hřídel je rozdílný.

## 10. Pevnostní, deformační a modální analýza skříně převodovky

### 10.1. Pevnostní a deformační analýza skříně

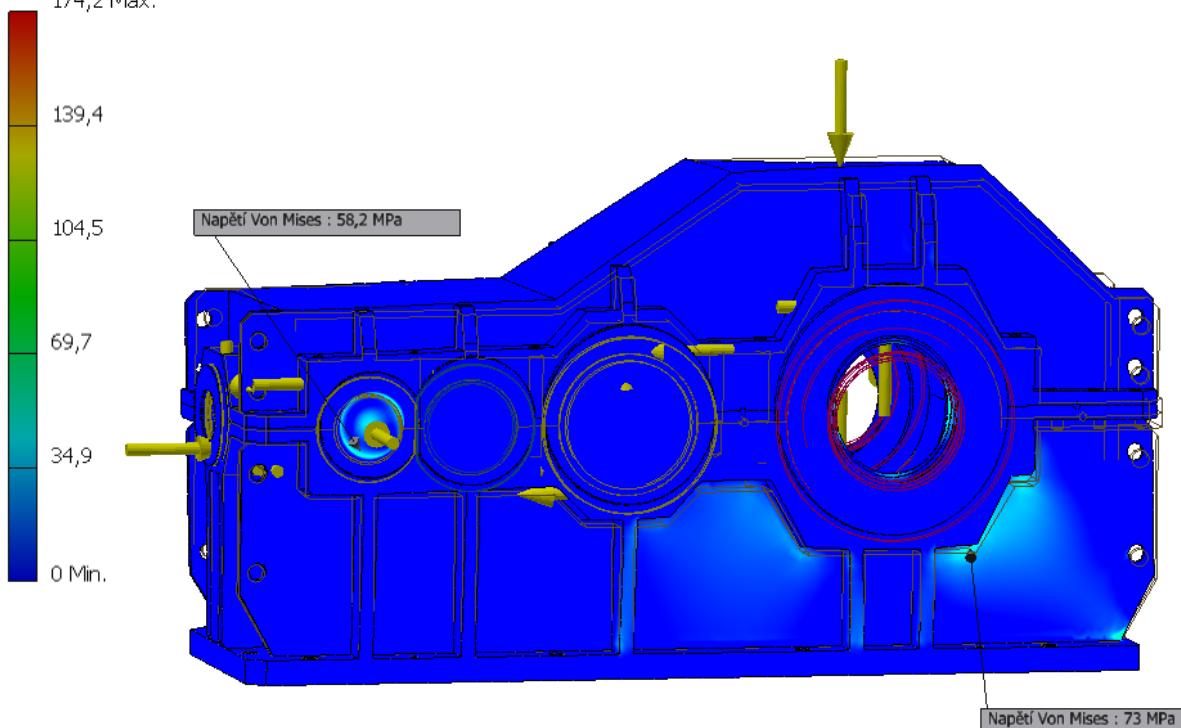

Příprava pro spuštění výpočtu v softwaru Inventor Professional 2013 spočívala v použití vany a víka skříně. Otvory pro hřídele jsem osadila víčky. Podle údajů o reakcích v ložiskách z výpočtu KISSsoftem jsem umístila příslušné síly do modelu. Přidala jsem působení gravitace a model zasítovala (Obr. 10-1).

Obr. 10-1 Příprava modelu pro pevnostní a deformační analýzu

## Výsledky deformační analýzy

Typ: Posunutí  
Jednotka: mm  
3.5.2014, 0:17:29  
0,7059 Max.

Obr. 10-3 Výsledky deformační analýzy skříně

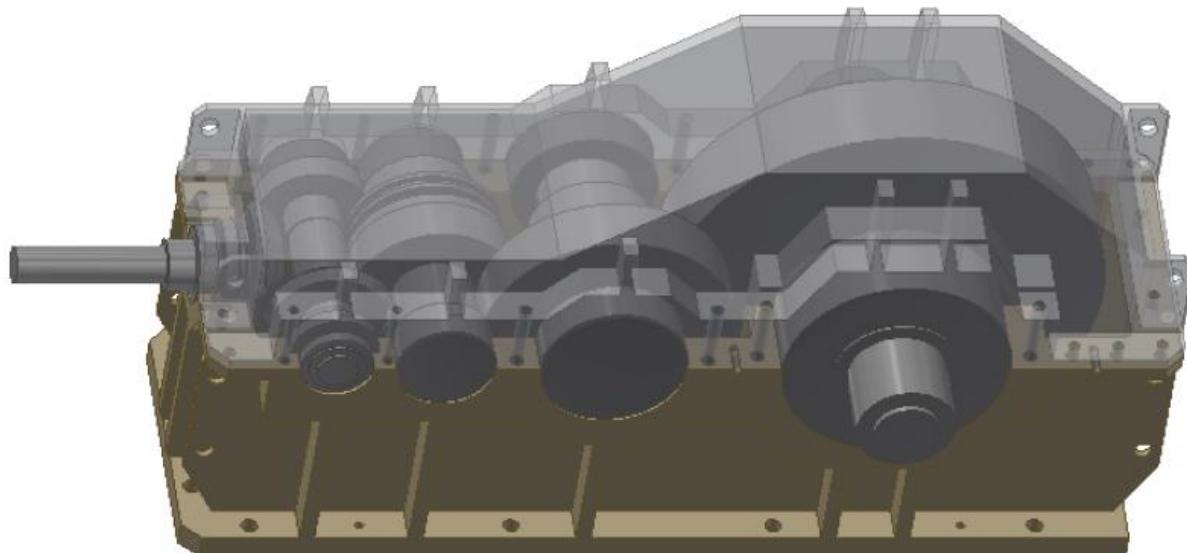

Napětí Von Mises deformační analýza jsou dva nejčastěji využívané. Celá zpráva z analýzy je uvedena v příloze. Materiálové hodnoty použité při výpočtu jsou: mez kluzu  $R_e = 207$  MPa, mez pevnosti  $R_m = 345$  MPa, modul pružnosti  $E = 2,2 \cdot 10^5$  MPa odpovídají oceli obvyklých jakostí vhodné ke svařování třídy 11.

Návrh skříně pevnostně vyhovuje s bezpečností proti mezi kluzu cca 2,8. Červeně vykreslená maxima jsou na hranách vícka výstupního hřídele a vykazují hodnotu 174,2 MPa. Je to způsobeno odstraněním zaoblení hran v rámci zjednodušení geometrie pro výpočtový model. Hrany se tak staly koncentrátorem napětí. Ve skutečnosti tam špičky napětí nebudou.

Výsledky deformační analýzy jsou ovlivněny zjednodušením modelu pro výpočet. Skřín navíc ještě využívá díly, které nebyly součástí řešení této DP, ale ve skutečnosti budou k převodovce připojeny (např. hydromotor pro pohon přesouvací spojky a kryty připojení konců výstupního hřídele k navijáku lana). Velikosti posunutí jsou vyhovující.

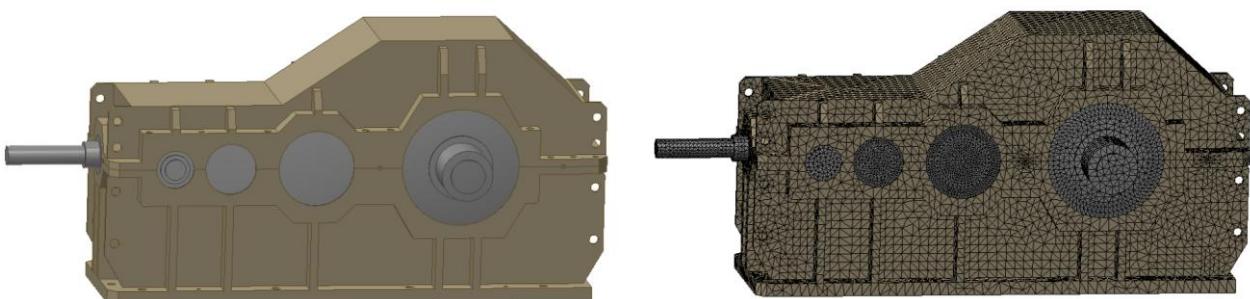

## 10.2. Modální analýza převodovky

V rámci přípravy pro provedení modální analýzy jsem nahradila modely jednotlivých vnitřních komponent převodovky jinými, velmi zjednodušenými. Odstranila jsem malá zaoblení a zkosení, ozubení jsem nahradila válci se stejnými průměry, jako jsou průměry roztečných kružnic. Šrouby spojující víko a vanu skříně jsem odstranila. V modelu není rovněž počítáno s olejovou náplní převodovky.

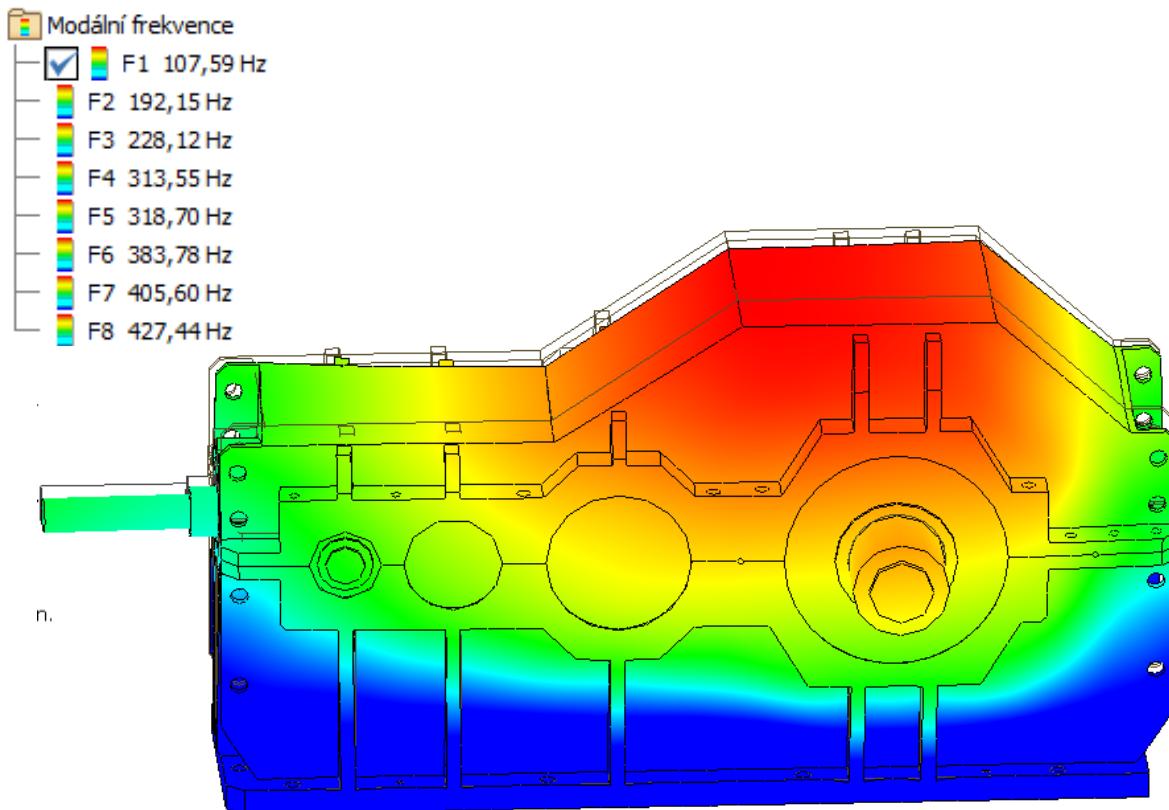

Obr. 10-4 Náhrada modelů komponent

Poté jsem provedla zasíťování modelu podobně jako pro předchozí výpočet.

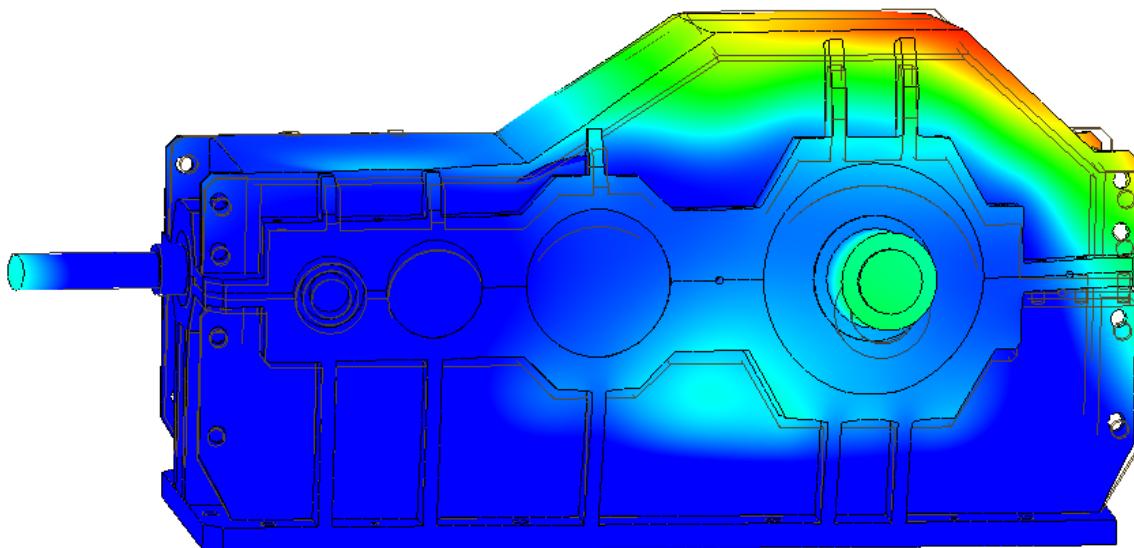

Obr. 10-5 3D model s náhradami komponent a jeho zasíťování

## Výsledky modální analýzy

Obr. 10-6 První vlastní tvar kmitu

Řešením modální analýzy jsem získala informace o vlastních frekvencích převodovky (Obr. 10-6), které jsem dále využila pro srovnání s vlastními frekvencemi hřídelů a se zubovými frekvencemi. Součástí výsledků jsou i krátké animace vlastních tvarů kmitů. Celková zpráva z analýzy je zařazena do přílohy. Zde jsem vybrala pro ilustraci znázornění prvního a sedmého vlastního tvaru kmitu.

Obr. 10-7 Sedmý vlastní tvar kmitu

### 10.3. Porovnání frekvencí

Porovnání frekvencí děláme z toho důvodu, abychom předešli nepříznivým stavům rezonance. Stav, kdy se budicí frekvence příliš blíží vlastní frekvenci má za následek enormní růst působících sil a může vést k poškození součásti nebo celého zařízení.

Vlastní frekvence Hřídele 0 s dvouřadým soudečkovým ložiskem SKF\*23030 CC/W33 a párovým kuželíkovým ložiskem v provedení čely k sobě SKF 32030 X/DF.

Z vlastních frekvencí jsem pro další porovnání vybrala jen ty, které by bylo v provozu reálně možné dosáhnout. Maximální otáčky jsou 800 ot/min. Vlastní frekvence dosažené při vyšších otáčkách jsem do porovnání nezahrnula.

Zubové frekvence vznikají narážením boků zubů při záběru s protikolem. Zubové frekvence jsem spočítala ze vztahu

$$f_z = \frac{z \cdot n}{60} [\text{Hz}]$$

Graf 4 ukazuje, které hřídele by se mohly podílet na buzení skříně. K zubovým frekvencím zde nepřihlížím.

Graf 4 Porovnání vlastních frekvencí skříně s vlastními frekvencemi hřídelů

Graf 5 zahrnuje frekvence skříně, hřídelů a zubové frekvence. Pásma, kde se vyskytují vlastní frekvence skříně, je vyznačeno dvěma vodorovnými linkami. Hodnoty vlastní frekvence při jednotlivých tvarech kmitu jsou vyznačeny červeným sloupcem. Hodnoty hřídelů jsou nízké a v grafu se projevili jen jako linka u vodorovné osy. Zubové frekvence při 1. převodovém stupni jsou vyznačeny růžově, zubové frekvence vznikající při druhém převodovém stupni jsou znázorněny žlutým sloupcem.

**Graf 5 Porovnání vlastních frekvencí skříně, hřídelů a zubových frekvencí**

Zubové frekvence a vlastní frekvence skříně jsou rozdílné. Pro přesnější posouzení by bylo třeba uvažovat se všemi částmi převodovky.

## 11. Závěr

Úkolem diplomové práce bylo navrhnutí převodovky, které se liší polohou vstupní a výstupní osy (rovnoběžné hřídele a kolmé hřídele). Další požadavek byl na co největší počet společných dílů, tj. aby se převodovky lišily jen na vstupní části a vlastní těleso skříně se lišilo jen v detailech.

Ze zadaných parametrů jsem navrhla první varianty čelní a kuželové převodovky. Po následné konzultaci se zadavatelem vznikl požadavek na zvýšení tuhosti hřídelů na vstupu i výstupu převodovky.

Finální návrh je patrný z kapitoly 9 (část 9.2 a 9.3). Převodovku typu KC jsem navrhla ve dvou variantách uložení vstupního hřídele. Hlavní parametry jednotlivých variant jsou uvedeny v Tab. 11-1.

Sledované parametry	První návrh	Stejný motor	Stejný výstupní moment
Převod	$i$	54,485 / 14,825	44,676 / 14,727
Moment	$M_t$ [Nm]	6.000	6.000
Vstupní otáčky	$n_1$ [ $\text{min}^{-1}$ ]	800	800
Výstupní otáčky	$n_2$ [ $\text{min}^{-1}$ ]	14,68 / 53,96	17,91 / 54,32

Tab. 11-1 Sledované parametry pro řešené možnosti

Po navržení řešení jsem zjistila kompletní vlastnosti převodové skříně (pevnost a tuhost) a provedla jsem analýzu převodovky metodou MKP a výsledky porovnala.

Výsledné navržené převodovky jsou ve formě 3D uvedené v diplomové práci. Pro ilustraci jsou v příloze výkresy ve 2D. V příloze jsou také výsledky výpočtů.

Návrh konstrukčního řešení splňuje zadané parametry a požadavky na zvýšenou tuhost.

## 9. DETERMINATION OF TOOTHFORM

Data for the tooth form calculation :

Data not available.

### REMARKS:

- Specifications with [e/i] imply: Maximum [e] and Minimal value [i] with consideration of all tolerances  
Specifications with [.m] imply: Mean value within tolerance
- For the backlash tolerance, the center distance tolerances and the tooth thickness deviation are taken into account. Shown is the maximal and the minimal backlash corresponding the largest resp. the smallest allowances  
The calculation is done for the Operating pitch circle..
- Details of calculation method:  
cg according to method B  
KV according to method B  
KHb, KFb according method C  
KHa, KFa according to method B

## 9. DETERMINATION OF TOOTHFORM

Data for the tooth form calculation :

### **Calculation of Gear 1**

Tooth form, Gear 1, Step 1: automatic (final treatment)

haP\*= 1.043, hfP\*= 1.250, rofP\*= 0.250

### **Calculation of Gear 2**

Tooth form, Gear 2, Step 1: automatic (final treatment)

haP\*= 1.043, hfP\*= 1.250, rofP\*= 0.250

### **REMARKS:**

- Specifications with [e/i] imply: Maximum [e] and Minimal value [i] with consideration of all tolerances  
Specifications with [m] imply: Mean value within tolerance
- For the backlash tolerance, the center distance tolerances and the tooth thickness deviation are taken into account. Shown is the maximal and the minimal backlash corresponding the largest resp. the smallest allowances  
The calculation is done for the Operating pitch circle..
- Details of calculation method:

cg according to method B

KV according to method B

KH<sub>b</sub>, KF<sub>b</sub> according method C

KH<sub>a</sub>, KF<sub>a</sub> according to method B

## 9. DETERMINATION OF TOOTHFORM

Data for the tooth form calculation :

Data not available.

### REMARKS:

- Specifications with [e/i] imply: Maximum [e] and Minimal value [i] with consideration of all tolerances  
Specifications with [.m] imply: Mean value within tolerance
- For the backlash tolerance, the center distance tolerances and the tooth thickness deviation are taken into account. Shown is the maximal and the minimal backlash corresponding the largest resp. the smallest allowances  
The calculation is done for the Operating pitch circle..
- Details of calculation method:  
cg according to method B  
KV according to method B  
KHb, KFb according method C  
KHa, KFa according to method B

## 9. DETERMINATION OF TOOTHFORM

Data for the tooth form calculation :

Data not available.

### REMARKS:

- Specifications with [e/i] imply: Maximum [e] and Minimal value [i] with consideration of all tolerances  
Specifications with [.m] imply: Mean value within tolerance
- For the backlash tolerance, the center distance tolerances and the tooth thickness deviation are taken into account. Shown is the maximal and the minimal backlash corresponding the largest resp. the smallest allowances  
The calculation is done for the Operating pitch circle..
- Details of calculation method:  
cg according to method B  
KV according to method B  
KHb, KFb according method C  
KHa, KFa according to method B

**Important hint: At least one warning has occurred during the calculation:**

1-> For shaft with internal diameter the notch factors are limited.

Non of the known calculation methods produces reliable data. It is proposed to use the data for the full shaft and to judge the results conservatively

**Important hint: At least one warning has occurred during the calculation:**

1-> For shaft with internal diameter the notch factors are limited.

Non of the known calculation methods produces reliable data. It is proposed to use the data for the full shaft and to judge the results conservatively

**Analysis of shafts, axle and beams**

**Important hint: At least one warning has occurred during the calculation:**

1-> For shaft with internal diameter the notch factors are limited.

Non of the known calculation methods produces reliable data. It is proposed to use the data for the full shaft and to judge the results conservatively

**Analysis of shafts, axle and beams**

**Important hint: At least one warning has occurred during the calculation:**

1-> For shaft with internal diameter the notch factors are limited.

Non of the known calculation methods produces reliable data. It is proposed to use the data for the full shaft and to judge the results conservatively

(\*) Note concerning roller bearings with approximated bearing geometry:

The inner geometry of these bearings is not charted in the data base.

The geometry is calculated backwards from C and C0 (values in the manufacturer catalog) according to ISO281.

Therefore the calculated geometry can differ from the real geometry.

Differences in the bearing stiffness results can be considerable in some cases.

(\*) Note concerning roller bearings with approximated bearing geometry:

The inner geometry of these bearings is not charted in the data base.

The geometry is calculated backwards from C and C0 (values in the manufacturer catalog) according to ISO281.

Therefore the calculated geometry can differ from the real geometry.

Differences in the bearing stiffness results can be considerable in some cases.

Remarks:

- The shearing force is not considered in the analysis specified in DIN 743.
- Cross section with interference fit:  
The notching factor for the light fit case is no longer defined in DIN 743.  
The values are imported from the FKM-Guideline..

**Important hint: At least one warning has occurred during the calculation:**

1-> For the raw diameter ( 390 mm) of the material (18CrNiMo7-6)

the database has no values

for tensile stress and yield point !

Guessed values are assumed.

For the input of material data:

Call the KISSsoft database tool in the menu Extras

2-> For the raw diameter ( 420 mm) of the material (18CrNiMo7-6)

the database has no values

for tensile stress and yield point !

Guessed values are assumed.

For the input of material data:

Call the KISSsoft database tool in the menu Extras

Woehler line (S-N curve) at the fatigue stress according: according to standard

Notice:

Calculation-method according to:

- ISO 6336, part 6

During the calculation all the load-coefficients (ISO6336: KV, KHb, KFb; AGMA2001: Knu, Km, ..) for each load spectrum element are calculated separately.

Notice:

Calculation with methods ISO6336 and AGMA 2001 results in a reduction

of resistance in the domain of fatigue resistance

(from circa 10^7 to 10^10 cycles with a reduction of circa 15 %).

The lifetime calculation takes this into account

(also with the S-N curve (Woehler Curve) of the Miner type).

Safety root: 0.94 0.81  
 Safety flank: 0.89 0.89

Safety scuffing (Integral) 2.38

Safety scuffing (Flash) 2.57

(Safety against scuffing/micropitting/EHT is indicated for the weakest element of the load spectrum.)

## 9. DETERMINATION OF TOOTHFORM

Data for the tooth form calculation :

### **Calculation of Gear 1**

Tooth form, Gear 1, Step 1: automatic (final treatment)

haP\*= 1.041, hfP\*= 1.250, rofP\*= 0.380

### **Calculation of Gear 2**

Tooth form, Gear 2, Step 1: automatic (final treatment)

haP\*= 1.041, hfP\*= 1.250, rofP\*= 0.380

REMARKS:

- Specifications with [e/i] imply: Maximum [e] and Minimal value [i] with consideration of all tolerances  
Specifications with [.m] imply: Mean value within tolerance
- For the backlash tolerance, the center distance tolerances and the tooth thickness deviation are taken into account. Shown is the maximal and the minimal backlash corresponding the largest resp. the smallest allowances  
The calculation is done for the Operating pitch circle..
- Details of calculation method:  
cg according to method B  
KV according to method B  
KH<sub>b</sub>, KF<sub>b</sub> according method C  
fma following equation (64), fsh following (57/58), Fbx following (52/53/57)  
KH<sub>a</sub>, KF<sub>a</sub> according to method B

## Key

Material	C45 (1)	
Type	Through hardened steel	
Treatment	unalloyed, through hardened	
Tensile strength (N/mm <sup>2</sup> )	[Rm]	650.00 (d=16-40mm)
Yield point (N/mm <sup>2</sup> )	[Re]	430.00 (d=16-40mm)

Pressure stress (N/mm <sup>2</sup> )	[peq]	178.88 /	162.88
Pressure stress (N/mm <sup>2</sup> )	[pmax]	178.88 /	162.88
Support factor	[fs]	1.10	
Hardness influence coefficient	[fH]	1.00	
Permissible surface pressure (N/mm <sup>2</sup> )	[pzul]	473.00	
Load peak frequency coefficient	[fL]	1.50	
Load direction changing coefficient	[fw]	1.00	
fw * pzul / peq		2.64	
fL * pzul / pmax		3.97	
Safety		2.64	
Cross section area (mm <sup>2</sup> )	[b*Itr]	3384.00	
Shear stress (N/mm <sup>2</sup> )	[tau]	39.40	

**Remarks:**

Safety = Minimum (fw\*pzul/peq, fL\*pzul/pmax)

Condition according to DIN 6892 Safety >= 1.0

Chamfer on key: Mean value as in examples in DIN 6892

Groove depth: Minimum value as in examples in DIN 6892

A 3D finite element model of the same mechanical assembly is shown from a different angle, highlighting a different set of features. The displacement distribution is more widespread than in the first model, with significant green and yellow areas indicating moderate displacement across the central and upper sections of the housing. A coordinate system with X, Y, and Z axes is visible at the bottom left. A legend on the left side shows the displacement values corresponding to the color scale.
