

INVESTMENTS IN EDUCATION DEVELOPMENT

in a variety of multidisciplinary projects with partners ranging from orthopaedic device producers through health professionals to automotive industry. The main topics of basic and applied research involve using engineering techniques to solve orthopaedic problems and develop new orthopaedic devices, understanding mechanical properties of tissues of cardiovascular system and application of advanced experimental methods in cell mechanics. Division of Biomechanics provides education in master study program Biomechanics and medical devices and Ph.D. study program Biomechanics.

Biomechanics research in Faculty of Physical Culture Palacký University Olomouc and Human Motion Diagnostic Center University of Ostrava

Z. Svoboda, M. Janura, M. Elfmark, D. Jandačka, F. Vaverka, J. Uchytil. R. Farana, D. Zahradník
Palacký University Olomouc and University of Ostrava, Czech Republic zdenek.svoboda@upol.cz

The biomechanical research activities of both departments deal with biomechanics of basic human motions in various groups of subjects, biomechanics of sport and physical activity. The most often used methods are: 3D kinematics (Vicon MX, Qualysis), ground reaction force measurement (Kistler), pressure distribution analysis (Footscan), electromyography (Delsys). Recently Olomouc group solve projects mainly in following topics: assessment of static and dynamic balance in various groups (young, middle age and older groups; subjects with amputations), the effect of rehabilitation on gait and balance in ballet dancers, the effect of treatment (surgery, orthotic, rehabilitation intervention) on gait in orthopaedic patients (knee, hip osteoarthrisis). Ostrava group nowadays solve, for example issues as the biomechanics of pathological running in people after Achilles tendon surgery, biomechanical risk factors for knee injury in volleyball, biomechanics of walking in people with a bionic knee after transfemoral amputation, the kinematics of vaults in gymnastics or load optimization in strength exercise.

Hemi-epiphysiodesis at the knee region: long - term results of Ambulant Centre for Defects of Locomotor Apparatus in Prague

I. Mařík, Š. Petrášová, R. Myslivec, D. Zemková Ambulant Centre for Defects of Locomotor Apparatus, Prague and Hospital Motol, Prague and Hospital Příbram and University of West Bohemia, Pilsen, Czech Republic

dezem@email.cz

The Ambulant Centre for Defects of Locomotor Apparatus in Prague has achieved very good results with permanent epiphysiodesis that was carried out both in cases of unequal leg length and at deformities around the knee joint. The goal of the communication is to present our last ten years of experience with anthropometric measurement of tibio-femoral angle, indication and timing of the surgery and long-term results of permanent hemi-epiphysiodesis (carried out by modified Macnicol's method using drilling of growth physis) that was indicated to children
